The iS7 sets the world standard for drives (VFDs) because of its features that meet all of your needs in AC drives.

The iS7 offers powerful performance, flexibility through diverse options, and a more convenient and user-friendly interface.

The iS7 offers more than you can imagine.

iS7 is dependable because it has high performance and reliability.

iS7 Feature | Reliability & High Performance

Reliability

► Powerful electric current type sensorless vector control
Our iS7 technology includes a competitive and strong low-speed torque control and a speed-precision-driven vector algorithm.

- Speed control range 100:1
- Extremely low torque control capability: 0.1Hz/150% real torque
- Max. torque control capability within the restoration range

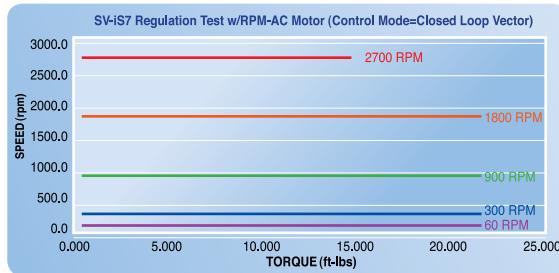

High Performance

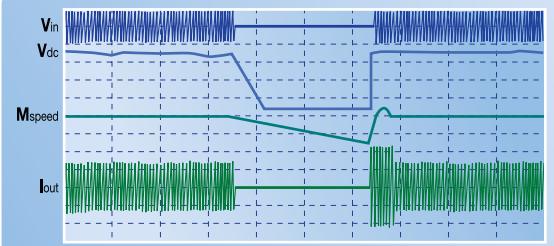

► Sensed vector realizing precise speed/torque control

In the entire speed range including zero speed, powerful torque (more than 250%) performance is materialized through receiving Max. 200kHz frequency pulse via encoder-dedicated board.

- Speed control range 1000:1
- Instant Max. torque control capability 250%
- 50Hz speed control response

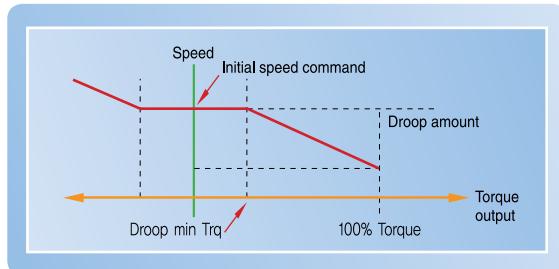

► Ride-through (LV trip delay) for sudden power loss

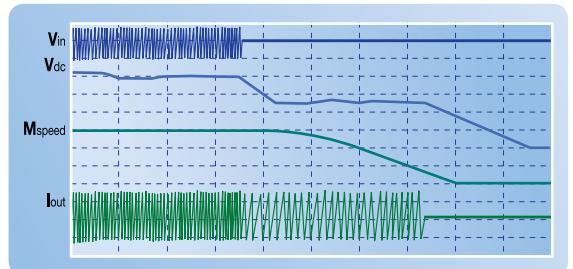

► Automatic torque balance droop control

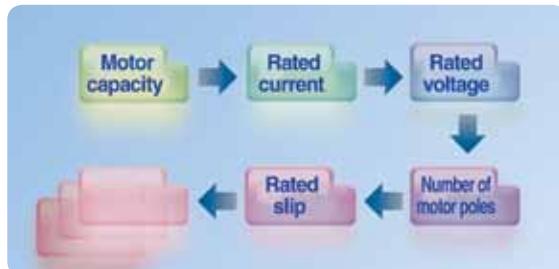

Droop control algorithm adjusts changeable torque driven by speed. This algorithm is easily applicable to open loop linking driving and load sharing driving.

► Kinetic Energy Buffering (KEB) for a stable system stop in case of power loss or failure

► Easy start parameter setting

► Power and flux braking for maximum deceleration

iS7 is flexible because it is easily expandable.

■ Dynamic Breaking (DB)Unit & DB resistor basic wiring

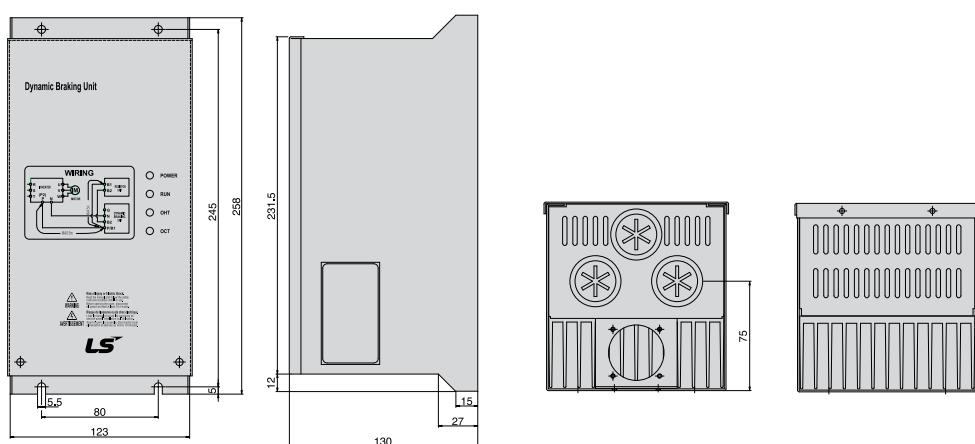

DBU Terminals	Description
B1, B2	Wire correctly referring to diagram. DB Resistors connect with B1,B2 of DB Unit

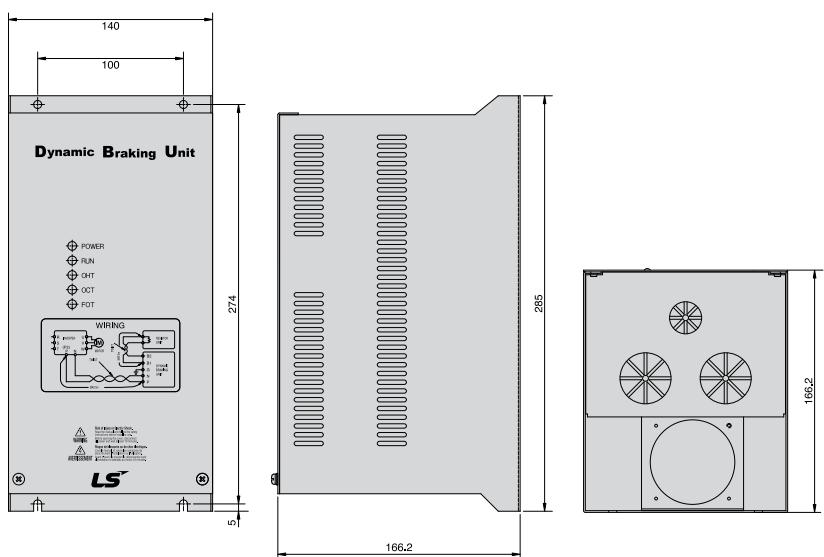

Peripheral Devices

Dimensions

Group 1

Group 2

Display Functions

DB Resistors connect with B1, B2 of DB Unit, DBU has 3 LEDs. Red LED which is located in middle displays supplying main power, one Green LED which is right side displays under breaking and another green LED which is left side displays Over Heat Trip(OHT).

Displays	Function description
POWER (Red LED)	POWER LED is turned On when main power is supplied. Generally, POWER LED is turn On while main power supplied because DBU is connected with drive
RUN (Green LED)	RUN LED is turned off while DBU is ON by regenerative energy of Motor.
OHT (Green LED)	Under Breaking, if the temperature is exceeded over setting value due to overheat of Heatsink, Cut the TURN ON signal of DBU and LED is turned on by working overheat protection function.
