The right choice for the ultimate yield!

LS ELECTRIC strives to maximize your profits in gratitude for choosing us as your partner.

AC Variable Speed Drive

LSLV-S100 series

User's Maunal

0.4-75kW [200V,400V]

▲ Safety Instructions

- Read this manual carefully before installing, wiring, operating, servicing or inspecting this equipment.
- Keep this manual within easy reach for quick reference.

This operation manual is intended for users with basic knowledge of electricity and electric devices.

* LSLV-S100 is the official name for S100.

Safety Information

Read and follow all safety instructions in this manual precisely to avoid unsafe operating conditions, property damage, personal injury, or death.

Safety symbols in this manual

🛕 Danger

Indicates an imminently hazardous situation which, if not avoided, will result in severe injury or death.

A Warning

Indicates a potentially hazardous situation which, if not avoided, could result in injury or death.

Caution

Indicates a potentially hazardous situation that, if not avoided, could result in minor injury or property damage.

Safety information

🛕 Danger

- Do not open the cover of the equipment while it is on or operating. Likewise, do not operate
 the inverter while the cover is open. Exposure of high voltage terminals or charging area
 to the external environment may result in an electric shock. Do not remove any covers
 or touch the internal circuit boards (PCBs) or electrical contacts on the product when
 the power is on or during operation. Doing so may result in serious injury, death, or
 serious property damage.
- Do not open the cover of the equipment even when the power supply to the inverter has been turned off unless it is necessary for maintenance or regular inspection.
 Opening the cover may result in an electric shock even when the power supply is off.
- The equipment may hold charge long after the power supply has been turned off. Use a multi-meter to make sure that there is no voltage before working on the inverter, motor or motor cable.

\Lambda Warning

- This equipment must be grounded for safe and proper operation.
- Do not supply power to a faulty inverter. If you find that the inverter is faulty, disconnect the power supply and have the inverter professionally repaired.
- The inverter becomes hot during operation. Avoid touching the inverter until it has cooled to avoid burns.
- Do not allow foreign objects, such as screws, metal chips, debris, water, or oil to get inside the inverter. Allowing foreign objects inside the inverter may cause the inverter to malfunction or result in a fire.
- Do not operate the inverter with wet hands. Doing so may result in electric shock.
- Check the information about the protection level for the circuits and devices.

The following connection terminals and devices are the Protective Class 0. It means that the circuit protection level depends on the basic insulation. If there is no basic insulation is failed, it may cause electric shock accident. When installing or wiring the connection terminals and devices, take the same protective action as with the power wire.

- Multi-function Input: P1-P7, CM
- Analog Frequency Input: VR, V1, I2, TI
- Safety Function: SA, SB, SC
- Analog Output: AO, AO1, AO2, TO
- Digital Output: Q1, EG, 24, A1, B1, C1, A2, C2
- Communication: S+/ S-/ SG
- Fan

• The protection level of this equipment (inverter) is the Electrical ProtectiveClass I.

① Caution

- Do not modify the interior workings of the inverter. Doing so will void the warranty.
- The inverter is designed for 3-phase motor operation. Do not use the inverter to operate a single phase motor.
- Do not place heavy objects on top of electric cables. Doing so may damage the cable and result in an electric shock.

Note

Maximum allowed prospective short-circuit current at the input power connection is defined in IEC 60439-1 as 100 kA. Depending on the selected MCCB, the LSLV-S100 Series is suitable for use in circuits capable of delivering a maximum of 100 kA RMS symmetrical amperes at the drive's maximum rated voltage. The following table shows the recommended MCCB for RMS symmetrical amperes.

Remarque

Le courant maximum de court-circuit présumé autorisé au connecteur d'alimentation électrique est défini dans la norme IEC 60439-1 comme égal à 100 kA. Selon le MCCB sélectionné, la série LSLV-S100 peut être utilisée sur des circuits pouvant fournir un courant RMS symétrique de 100 kA maximum en ampères à la tension nominale maximale du variateur. Le tableau suivant indique le MCCB recommandé selon le courant RMS symétrique en ampères.

Working Voltage	UTE100(E/N)	UTS150(N/H/L)	ABS33c	ABS53c	ABS63c	ABS103c
240V(50/60Hz)	50/65 kA	65/100/150 kA	30 kA	35 kA	35 kA	85 kA
480V(50/60Hz)	25/35 kA	35/65/100 kA	7.5 kA	10 kA	10 kA	26 kA

Working Voltage	UTS150 (N/H/L)	UTS250 (N/H/L)	UTS400 (N/H/L)	ABS103c	ABS203c	ABS403c
480V(50/60Hz)	35/65/100kA	35/65/100kA	35/65/100kA	26kA	26kA	35kA

1 Preparing the Installation

This chapter provides details on product identification, part names, correct installation and cable specifications. To install the inverter correctly and safely, carefully read and follow the instructions.

1.1 Product Identification

The S100 Inverter is manufactured in a range of product groups based on drive capacity and power source specifications. Product name and specifications are detailed on the rating plate. The illustration on the next page shows the location of the rating plate. Check the rating plate before installing the product and make sure that the product meets your requirements. For more detailed product specifications, refer to <u>7.1 Input and Output</u> <u>Specification</u> on page <u>203</u>.

Note

Check the product name, open the packaging, and then confirm that the product is free from defects. Contact your supplier if you have any issues or questions about your product.

S - 5mm

1.2 Part Names

Г

The illustration below displays part names. Details may vary between product groups.

1.2.1 0.4-22kW Models

0.4-2.2kW (Single Phase) and 0.4-4.0kW (3-Phase)

5.5-22kW(3-Phase)

Note

ſ

The grounding terminal cover of EMC is not existed in the 55-75kW inverters.

1.2.3 IP66 Models

Do not operate Disconnect Switch when motor is operating.

The installation location for cooling fan varies according to product capacity. Inside the product: 0.4-4.0kW; bottom of the product: 5.5-7.5kW; inside and top of the product: 11-22kW.

NP(Non-PDS) type have not the Power Disconnect Switch.

Front cover removed

ſ

1.3 Installation Considerations

Inverters are composed of various precision, electronic devices, and therefore the installation environment can significantly impact the lifespan and reliability of the product. The table below details the ideal operation and installation conditions for the inverter.

Items	Description
Ambient Temperature*	Heavy Duty: 14–104°F (-10–50℃) Normal Duty: 14–122°F (-10– 40℃)
Ambient Humidity	90% relative humidity (no condensation)
Storage Temperature	- 4–149°F (-20–65℃)
Environmental Factors	An environment free from corrosive or flammable gases, oil residue or dust
Altitude / Vibration	Maximum 1000m above sea level for standard operation. From 1000 to 4000m, the rated input voltage and rated output current of the drive must be derated by 1% for every 100m. / less than 1G (9.8m/sec ²)
Air Pressure	70 –106kPa

* The ambient temperature is the temperature measured at a point 2" (5 cm) from the surface of the inverter.

* IP66 models only support heavy load operation, and an ambient temperature of between -10° C - +40°C.

① Caution

Do not allow the ambient temperature to exceed the allowable range while operating the inverter.

1.4 Selecting and Preparing a Site for Installation

When selecting an installation location consider the following points:

- The location must be free from vibration, and the inverter must be installed on a wall that can support the inverter's weight.
- The inverter can become very hot during operation. Install the inverter on a surface that is fire-resistant or flame-retardant and with sufficient clearance around the inverter to allow air to circulate. The illustrations below detail the required installation clearances.

• Ensure sufficient air circulation is provided around the inverter when it is installed. If the inverter is to be installed inside a panel, enclosure, or cabinet rack, carefully consider the position of the inverter's cooling fan and the ventilation louver. The cooling fan must be positioned to efficiently transfer the heat generated by the operation of the inverter.

l

- If you are installing multiple inverters in one location, arrange them side-by-side and remove the top covers. The top covers MUST be removed for side-by-side installations. Use a flat head screwdriver to remove the top covers.
- Side-by-side operation only supports 0.4-22kW, IP20 models.

I

• If you are installing multiple inverters, of different ratings, provide sufficient clearance to meet the clearance specifications of the larger inverter.

1.5 Cable Selection

When you install power and signal cables in the terminal blocks, only use cables that meet the required specification for the safe and reliable operation of the product. Refer to the following information to assist you with cable selection.

① Caution

- Wherever possible use cables with the largest cross-sectional area for mains power wiring, to ensure that voltage drop does not exceed 2%.
- Use copper cables rated for 600V, 75℃ for power terminal wiring.
- Use copper cables rated for 300V, 75°C for control terminal wiring.

		Gro	und		Powe	r I/O	
Load (kW	Load (kW)		AWG	VG mm ²		AW	
		mm ²	Ano	R/S/T	U/V/W	R/S/T	U/V/W

* Standard I/O doesn't support P6/P7/TI/TO terminal. Refer to <u>Step 4 Control Terminal</u> <u>Wiring on page 39</u>.

2 Installing the Inverter

This chapter describes the physical and electrical installation methods, including mounting and wiring of the product. Refer to the flowchart and basic configuration diagram provided below to understand the procedures and installation methods to be followed to install the product correctly.

Installation Flowchart

The flowchart lists the sequence to be followed during installation. The steps cover equipment installation and testing of the product. More information on each step is referenced in the steps.

LSELECTRIC | 15

Basic Configuration Diagram

The reference diagram below shows a typical system configuration showing the inverter and peripheral devices.

Prior to installing the inverter, ensure that the product is suitable for the application (power rating, capacity, etc). Ensure that all of the required peripherals and optional devices (resistor brakes, contactors, noise filters, etc.) are available. For more details on peripheral devices, refer to <u>7.4 Peripheral Devices</u> on page <u>228</u>.

① Caution

- Figures in this manual are shown with covers or circuit breakers removed to show a more detailed view of the installation arrangements. Install covers and circuit breakers before operating the inverter. Operate the product according to the instructions in this manual.
- Do not start or stop the inverter using a magnetic contactor, installed on the input power supply.
- If the inverter is damaged and loses control, the machine may cause a dangerous situation. Install an additional safety device such as an emergency brake to prevent these situations.
- High levels of current draw during power-on can affect the system. Ensure that correctly rated circuit breakers are installed to operate safely during power-on situations.
- Reactors can be installed to improve the power factor. Note that reactors may be installed within 30 ft (9.14 m) from the power source if the input power exceeds 10 times 0f inverter capacity. Refer to <u>7.5 Fuse and Reactor Specifications on page 229</u> and carefully select a reactor that meets the requirements.
- 30-75kW models have a built-in DC Reactor.

2.1 Mounting the Inverter

Mount the inverter on a wall or inside a panel following the procedures provided below. Before installation, ensure that there is sufficient space to meet the clearance specifications, and that there are no obstacles impeding the cooling fan's air flow.

Select a wall or panel suitable to support the installation. Refer to <u>7.3 External Dimensions</u> on page <u>213</u> and check the inverter's mounting bracket dimensions.

- 1 Use a level to draw a horizontal line on the mounting surface, and then carefully mark the fixing points.
- 2 Drill the two upper mounting bolt holes, and then install the mounting bolts. Do not fully tighten the bolts at this time. Fully tighten the mounting bolts after the inverter has been mounted.

3 Mount the inverter on the wall or inside a panel using the two upper bolts, and then fully tighten the mounting bolts. Ensure that the inverter is placed flat on the mounting surface, and that the installation surface can securely support the weight of the inverter.

Note

٢

The quantity and dimensions of the mounting brackets vary based on frame size. Refer to <u>7.3</u> <u>External Dimensions</u> on page <u>213</u> for detailed information about your model.

0.4kW (Single Phase) and 0.4-0.8kW (3-phase) inverters have only two mounting brackets.

① Caution

- Do not transport the inverter by lifting with the inverter's covers or plastic surfaces. The inverter may tip over if covers break, causing injuries or damage to the product. Always support the inverter using the metal frames when moving it.
- High-capacity inverters are very heavy and bulky. Use an appropriate transport method that is suitable for the weight.
- Do not install the inverter on the floor or mount it sideways against a wall. The inverter MUST be installed vertically, on a wall or inside a panel, with its rear flat on the mounting surface.

2.2 Cable Wiring

Open the front cover, remove the cable guides and control terminal cover, and then install the ground connection as specified. Complete the cable connections by connecting an appropriately rated cable to the terminals on the power and control terminal blocks.

Read the following information carefully before carrying out wiring connections to the inverter. All warning instructions must be followed.

① Caution

- Install the inverter before carrying out wiring connections.
- Ensure that no small metal debris, such as wire cut-offs, remain inside the inverter. Metal debris in the inverter may cause inverter failure.
- Tighten terminal screws to their specified torque. Loose terminal block screws may allow the cables to disconnect and cause short circuit or inverter failure. Refer to <u>7.6 Terminal</u> <u>Screw Specification</u> on page <u>231</u> for torque specifications.
- Do not place heavy objects on top of electric cables. Heavy objects may damage the cable and result in electric shock.
- The power supply system for this equipment (inverter) is a grounded system. Only use a grounded power supply system for this equipment (inverter). Do not use a TT, TN, IT, or corner grounded system with the inverter.
- The equipment may generate direct current in the protective ground wire. When installing the residual current device (RCD) or residual current monitoring (RCM), only Type B RCDs and RCMs can be used.
- Use cables with the largest cross-sectional area, appropriate for power terminal wiring, to ensure that voltage drop does not exceed 2%.
- Use copper cables rated at 600V, 75 °C for power terminal wiring.
- Use copper cables rated at 300V, 75 °C for control terminal wiring.
- Separate control circuit wires from the main circuits and other high voltage circuits(200V relay sequence circuit).
- Check for short circuits or wiring failure in the control circuit. They could cause system failure or device malfunction.
- Use shielded cables when wiring the control circuit. Failure to do so may cause malfunction due to interference. If a ground is needed, use STP (Shielded Twisted Pair) cables.
- If you need to re-wire the terminals due to wiring-related faults, ensure that the inverter keypad display is turned off and the charge lamp under the front cover is off before working on wiring connections. The inverter may hold a high voltage electric charge long after the power supply has been turned off.

Step 1 Front Cover, Control Terminal Cover and Cable Guide

The front cover, control terminal cover and cable guide must be removed to install cables. Refer to the following procedures to remove the covers and cable guide. The steps to remove these parts may vary depending on the inverter model.

0.8-1.5kW (single phase), 1.5-2.2kW (3-phase)

1 Loosen the bolt that secures the front cover (right side). Push and hold the latch on the right side of the cover. Then remove the cover by lifting it from the bottom and moving it away from the front of the inverter.

2 Remove the bolt that secures the front cover (left side) (1). Push and hold the latch on the left side of the cover. Then remove the cover by lifting it from the bottom and moving it away from the front of the inverter (2).

Г

3 Connect the cables to the power terminals and the control terminals. For cable specifications, refer to <u>1.5 Cable Selection</u> on page <u>13</u>.

LSELECTRIC 23

5.5-22kW (3-phase)

1 Loosen the bolt that secures the front cover. Then remove the cover by lifting it from the bottom and away from the front.

2 Push and hold the levers on both sides of the cable guide (●) and then remove the cable guide by pulling it directly away from the front of the inverter (②). In some models where the cable guide is secured by a bolt, remove the bolt first.

3 Push and hold the tab on the right side of the control terminal cover. Then remove the cover by lifting it from the bottom and moving it away from the front of the inverter.

4 Connect the cables to the power terminals and the control terminals. For cable specifications, refer to <u>1.5 Cable Selection</u> on page <u>13</u>.

Note

To connect an LCD loader, remove the plastic knock-out from the bottom of the front cover (right side). Connect the signal cable of the LCD loader to the RJ-45 port on the control board. (0.4-22kW models only)

30-75kW(3-phase 4type)

1 Loosen the bolt that secures the terminal cover (**①**). Push and hold the latch on the right side of the cover (**②**). Then remove the cover by lifting it from the bottom and moving it away from the front of the inverter.

2 Connect the cables to the power terminals and the control terminals. For cable specifications, refer to <u>1.5 Cable Selection</u> on page <u>13</u>.

IP66

Γ

0.4-15kW (3-phase 2type), 0.4-22kW (3-phase 4type)

1 Loosen the bolt that secures the front cover. Then remove the cover by lifting it from the bottom and moving it away from the front of the inverter.

2 Set the bushing to every wiring hole before installing to power and I/O board terminals. Use the bushing that is NEMA 4X (IP66) or more.

3 Connect the cables to the power terminals and the control terminals. For cable specifications, refer to <u>1.5 Cable Selection</u> on page <u>13</u>.

Note

To connect an LCD loader, remove the plastic knock-out from the bottom of the front cover (right side). Connect the signal cable of the LCD loader to the RJ-45 port on the control board. (0.4-22kW models only)

Step 2 Ground Connection

Remove the front cover(s), cable guide, and the control terminal cover. Then follow the instructions below to install the ground connection for the inverter.

Note

- 200 V products require Class 3 grounding. Resistance to ground must be < 100Ω.
- 400 V products require Special Class 3 grounding. Resistance to ground must be < 10Ω .

\land Warning

Install ground connections for the inverter and the motor by following the correct specifications to ensure safe and accurate operation. Using the inverter and the motor without the specified grounding connections may result in electric shock.

0.4-22kW

1 Locate the ground terminal and connect an appropriately rated ground cable to the terminals. Refer to <u>1.5 Cable Selection</u> on page <u>13</u> to find the appropriate cable specification for your installation.

2 Connect the other ends of the ground cables to the supply earth (ground) terminal.

30-75kW

1 Locate the ground terminal and connect an appropriately rated ground cable to the terminals. Refer to <u>1.5 Cable Selection</u> on page <u>13</u> to find the appropriate cable specification for your installation.

2 Connect the other ends of the ground cables to the supply earth (ground) terminal.

IP66

Г

1 Locate the ground terminal and connect an appropriately rated ground cable to the terminals. Refer to <u>1.5 Cable Selection</u> on page <u>13</u> to find the appropriate cable specification for your installation.

2 Connect the other ends of the ground cables to the supply earth (ground) terminal.

Step 3 Power Terminal Wiring

The following illustration shows the terminal layout on the power terminal block. Refer to the detailed descriptions to understand the function and location of each terminal before making wiring connections. Ensure that the cables selected meet or exceed the specifications in <u>1.5</u> <u>Cable Selection</u> on page <u>13</u> before installing them.

① Caution

- Apply rated torques to the terminal screws. Loose screws may cause short circuits and malfunctions. Tightening the screw too much may damage the terminals and cause short circuits and malfunctions.
- Use copper wires only with 600V, 75℃ rating for the power terminal wiring, and 300V, 75℃ rating for the control terminal wiring.
- Do not connect two wires to one terminal when wiring the power.
- Power supply wirings must be connected to the R, S, and T terminals. Connecting them to the U, V, W terminals causes internal damages to the inverter. Motor should be connected to the U, V, and W Terminals. Arrangement of the phase sequence is not necessary.

①Attention

- Appliquer des couples de marche aux vis des bornes. Des vis desserrées peuvent provoquer des courts-circuits et des dysfonctionnements. Ne pas trop serrer la vis, car cela risqué d'endommager les bornes et de provoquer des courts-circuits et des dysfonctionnements. Utiliser uniquement des fils de cuivre avec une valeur nominale de 600 V, 75 °C pour le câblage de la borne d'alimentation, et une valeur nominale de 300 V, 75 °C pour le câblage de la borne de commande.
- Ne jamais connecter deux câbles à une borne lors du câblage de l'alimentation.
- Les câblages de l'alimentation électrique doivent être connectés aux bornes R, S et T. Leur connexion aux bornes U, V et W provoque des dommages internes à l'onduleur. Le moteur doit être raccordé aux bornes U, V et W. L'arrangement de l'ordre de phase n'est pas nécessaire.

Note

- Do not use 3 core cables to connect a remotely located motor with the inverter.
- When you operating Brake resistor, the motor may vibrate under the Flux braking operation. In this case, please turn off the Flux braking(Pr.50).
- Make sure that the total cable length does not exceed 665ft (202m). For inverters < = 4.0kW capacity, ensure that the total cable length does not exceed 165ft (50m).
- Long cable runs can cause reduced motor torque in low frequency applications due to voltage drop. Long cable runs also increase a circuit's susceptibility to stray capacitance and may trigger over-current protection devices or result in malfunction of equipment connected to the inverter.
- Voltage drop is calculated by using the following formula: *Voltage Drop (V) = [√3 X cable resistance (m_Ω/m) X cable length (m) X current(A)] /* 1000
- Use cables with the largest possible cross-sectional area to ensure that voltage drop is minimized over long cable runs. Lowering the carrier frequency and installing a micro surge filter may also help to reduce voltage drop.

Distance	< 165ft (50m)	< 330ft (100m)	> 330ft (100m)
Allowed Carrier Frequency	< 15 kHz (30-75kW: < 5 kHz)	< 5 kHz	< 2.5 kHz

\Lambda Warning

Do not connect power to the inverter until installation has been fully completed and the inverter is ready to be operated. Doing so may result in electric shock.

Caution

- Power supply cables must be connected to the R, S, and T terminals. Connecting power cables to other terminals will damage the inverter.
- Use insulated ring lugs when connecting cables to R/S/T and U/V/W terminals.
- The inverter's power terminal connections can cause harmonics that may interfere with other communication devices located near to the inverter. To reduce interference the installation of noise filters or line filters may be required.
- To avoid circuit interruption or damaging connected equipment, do not install phaseadvanced condensers, surge protection, or electronic noise filters on the output side of the inverter.
- To avoid circuit interruption or damaging connected equipment, do not install magnetic contactors on the output side of the inverter.

Step 4 Control Terminal Wiring

The illustrations below show the detailed layout of control wiring terminals, and control board switches. Refer to the detailed information provided below and <u>1.5 Cable Selection</u> on page <u>13</u> before installing control terminal wiring and ensure that the cables used meet the required specifications.

0.4-22kW

<Standard I/O>

Name	Description
Connector	Connect to iS7 Loader or Smart Copier

0.4-22kW

30-75kW

Input Terminal Labels and Descriptions

Function	Label	Name	Description
Multi- function	P1–P7	Multi-function Input 1-7	Configurable for multi-function input terminals. (Standard I/O is only provided for P5.)
terminal configuration	СМ	Common Sequence	Common terminal for analog terminal inputs and outputs.
Angleg input	VR	Potentiometer frequency reference input	 Used to setup or modify a frequency reference via analog voltage or current input. Maximum Voltage Output: 12V Maximum Current Output: 100mA, Potentiometer: 1–5kΩ
Analog input configuration	V1	Voltage input for frequency reference input	Used to setup or modify a frequency reference via analog voltage input terminal. • Unipolar: 0–10V (12V Max.) • Bipolar: -10–10V (±12V Max.)
	12	Voltage/current input for	Used to setup or modify a frequency reference via analog voltage or current input terminals.

Function	Label	Name	Description
		frequency reference input	 Switch between voltage (V2) and current (I2) modes using a control board switch (SW2). V2 Mode: Unipolar: 0–10V (12V Max.) I2 Mode Input current: 4–20mA Maximum Input current: 24mA
	TI	Pulse input for frequency reference input (pulse train)	 Input resistance: 249Ω Setup or modify frequency references using pulse inputs from 0 to 32kHz. Low Level: 0–2.5V High Level: 3.5–12V (In case of Standard I/O, Pulse input TI and Multifunction terminal P5 share the same terminal. Set the In.69 P5 Define to 54(TI).).
	SA	Safety input A	Used to block the output from the inverter in an emergency. Conditions:
Safety functionality configuration	SB	Safety input B	 Normal Operation: Both the SA and SB terminals are connected to the SC terminal. Output Block: One or both of the SA and SB terminals lose connection with the SC terminal.
	SC	Safety input power source	DC 24V, < 25mA

Γ

LSELECTRIC 43

Output/Communication Terminal Labels and Descriptions

Function	Label	Name	Description
	AO, AO1	Voltage/Current Output	Used to send inverter output information to external devices: output frequency, output current, output voltage, or a DC voltage. Operate switch (SW3) to select the signal output type (voltage or current) at the AO terminal. Output Signal Specifications: • Output voltage: 0–10V • Maximum output voltage/current: 12V/10mA • Output current: 0–20mA • Maximum output current: 24mA • Factory default output: Frequency
	AO2	Analog voltage output terminal	Use to send inverter output information, such as output frequency, output current, output voltage, or DC voltage to external devices. • Output voltage: 0-10 V • Maximum output voltage/current: 12V/10 mA
Analog output	то	Pulse Output	 Sends pulse signals to external devices to provide a single output value from the inverter of either: output frequency, output current, output voltage, or DC voltage. Output Signal Specifications: Output frequency: 0–32kHz Output voltage: 0–12V Factory default output: Frequency (In case of Standard I/O, Pulse output TO and Multi-function output Q1 share the same terminal. Set the OU.33Q1 Define to 38(TO).) When connecting to a pulse between the S100 inverters, Multiple I/O< -> Multiple I/O : Connect to TO -> TI, CM -> CM Standard I/O <-> Standard I/O : Do not support.
	Q1	Multi-functional (open collector)	DC 26V, 100mA or less Factory default output: Run
Digital output	EG	Common	Common ground contact for an open collector (with external power source)
	24 External 24V		Maximum output current: 150mA

٦

Function	Label	Name	Description
		power source	
		Fault signal	Sends out alarm signals when the inverter's safety features are activated (AC 250V <1A, DC 30V < 1A).
	A1/C1/B1	output	 Fault condition: A1 and C1 contacts are connected (B1 and C1 open connection) Normal operation: B1 and C1 contacts are connected (A1 and C1 open connection)
	A2, C2	Multi-functional relay output terminal	The signal is generated while operating. Define and use the multi-functional relay output terminal (Less than AC250 V 5A, Less than DC30 V 5A).
Communication	S+/S-/SG	RS-485 signal line	Used to send or receive RS-485 signals.
	NC	NC	Not in use.

Preinsulated Crimp Terminal Connectors (Bootlace Ferrule).

Use preinsulated crimp terminal connectors to increase reliability of the control terminal wiring. Refer to the specifications below to determine the crimp terminals to fit various cable sizes.

P/N	Cable	Spec.	Di	Dimensions (inches/mm)			Manufacturer
P/N	AWG	mm ²	L*	Р	d1	D	Manulacturer
CE002506	26	0.25	10.4	6.0	1.1	2.5	JEONO
CE002508	20	0.25	12.4	8.0	1.1	2.5	
CE005006	22	0.50	12.0	6.0	1.3	3.2	(Jeono Electric,
CE007506	20	0.75	12.0	6.0	1.5	3.4	http://www.jeono.com/)

* If the length (L) of the crimp terminals exceeds 0.5" (12.7mm) after wiring, the control terminal cover may not close fully.

To connect cables to the control terminals without using crimp terminals, refer to the following illustration detailing the correct length of exposed conductor at the end of the control cable.

Note

- While making wiring connections at the control terminals, ensure that the total cable length does not exceed 165ft (50m).
- Ensure that the length of any safety related wiring does not exceed 100ft (30m).
- Ensure that the cable length between an LCD keypad and the inverter does not exceed 10ft (3.04m). Cable connections longer than 10ft (3.04m) may cause signal errors.
- Use ferrite material to protect signal cables from electro-magnetic interference.
- Take care when supporting cables using cable ties, to apply the cable ties no closer than 6 inches from the inverter. This provides sufficient access to fully close the front cover.
- When making control terminal cable connections, use a small flat-tip screw driver (0.1in wide (2.5mm) and 0.015in thick (0.4mm) at the tip).

\Lambda Warning

SA,SB, SC, they are shorted, have 24V voltage. Do not connect power to the inverter until installation has been fully completed and the inverter is ready to be operated. Doing so may result in electric shock.

Step 5 PNP/NPN Mode Selection

The S100 inverter supports both PNP (Source) and NPN (Sink) modes for sequence inputs at the terminal. Select an appropriate mode to suit requirements using the PNP/NPN selection switch (SW1) on the control board. Refer to the following information for detailed applications.

PNP Mode (Source)

Select PNP using the PNP/NPN selection switch (SW1). Note that the factory default setting is NPN mode. CM is the common ground terminal for all analog inputs at the terminal, and P24 is 24V internal source. If you are using an external 24V source, build a circuit that connects the external source (-) and the CM terminal.

NPN Mode (Sink)

Select NPN using the PNP/NPN selection switch (SW1). Note that the factory default setting is NPN mode. CM is the common ground terminal for all analog inputs at the terminal, and P24 is 24V internal source.

l

Step 6 Disabling the EMC Filter for Power Sources with Asymmetrical Grounding

S100 built-in EMC filter prevents electromagnetic interference by reducing radio emissions from the inverter. EMC filter is activated as a factory default design. If an inverter uses a power source with an asymmetrical grounding connection or non-grounding, the EMC filter MUST be turned off. EMC filter use is not always recommended, as it increases leakage current. Refer to <u>Product Identification</u> on page <u>1</u> to check if inverters have built-in EMC filters.

Note

S100, 400 V, 55-75 kW products do not have built-in EMC filters.

A Danger

- Do not activate the EMC filter if the inverter uses a power source with an asymmetrical grounding structure, for example a grounded delta connection. Personal injury or death by electric shock may result.
- Wait at least 10 minutes before opening the covers and exposing the terminal connections. Before starting work on the inverter, test the connections to ensure all DC voltage has been fully discharged. Personal injury or death by electric shock may result.

Disabling the Built-in EMC Filter

0.4-22kW

Before using the inverter, confirm the power supply's grounding system. Disable the EMC filter if the power source has an asymmetrical grounding connection. Refer to the figures below to locate the EMC filter on/off terminal and replace the metal bolt with the plastic bolt. If the EMC filter is required in the future, reverse the steps and replace the plastic bolt with the metal bolt to reconnect the EMC filter.

Steel bolt	Plastic bolt
EMC ON	EMC OFF

30-75kW

I

Follow the instructions listed below to disable the EMC filters.

1 Remove the EMC ground cover located at the bottom of the inverter.

2 Remove the EMC ground cable from the right terminal (EMC filter-ON / factory default), and connect it to the left terminal (EMC filter-OFF / for power sources with asymmetrical grounding).

Note

The terminal on the right is used to ENABLE the EMC filter (factory default). The terminal on the left is used to DISABLE the EMC filter (for power sources with asymmetrical grounding).

Step 7 Selecting the brake unit (30-75kW models only)

UL form	Capacity of applied motor	Braking unit	
Non UL type	30-37kW	SV037DBH-4	
(A type)	45-55kW		
(A type)	75kW	SV075DBH-4, SV075DB-4	
Non UL type (B type)	30-37kW	LSLV0370DBU-4LN	
	30-37 KW	LSLV0370DBU-4HN	
	45-75kW	LSLV0750DBU-4LN	
UL type	30-37kW	SV370DBU-4U	
	45-55kW	SV550DBU-4U	
	75kW	SV750DBU-4U	

Select the brake unit as following:

Step 8 Re-assembling the Covers and Routing Bracket

After completing the wiring and basic configurations, re-assemble the control terminal cover, cable routing bracket, and front cover respectively. Note that the assembly procedure may vary according to the product group or frame size of the product.

2.3 Post-Installation Checklist

After completing the installation, check the items in the following table to make sure that the inverter has been safely and correctly installed.

1

Items	Check Point	Ref. <u>p.8</u>	Result
	Is the installation location appropriate?		
	Does the environment meet the inverter's operating conditions?	<u>p.9</u>	
Installation	Does the power source match the inverter's rated input?	p.203	
Location/Power I/O Verification	Is the inverter's rated output sufficient to supply the equipment? (Degraded performance will result in certain circumstances. Refer to <u>7.8 Continuous Rated Current</u> <u>Derating</u> on page <u>240</u> for details.	<u>p.203</u>	
	Is a circuit breaker installed on the input side of the inverter?		
	Is the circuit breaker correctly rated?	<u>p.203</u>	
	Are the power source cables correctly connected to the R/S/T terminals of the inverter? (Caution: connecting the power source to the U/V/W terminals may damage the inverter.)	<u>p.32</u>	
	Are the motor output cables connected in the correct phase rotation (U/V/W)? (Caution: motors will rotate in reverse direction if three phase cables are not wired in the correct rotation.)		
Power Terminal	Are the cables used in the power terminal connections correctly rated?	<u>p.13</u>	
Wiring	Is the inverter grounded correctly?	<u>p.29</u>	
	Are the power terminal screws and the ground terminal screws tightened to their specified torques?	<u>p. 32</u>	
	Are the overload protection circuits installed correctly on the motors (if multiple motors are run using one inverter)?	-	
	Is the inverter separated from the power source by a magnetic contactor (if a braking resistor is in use)?	<u>p.16</u>	
	Are advanced-phase capacitors, surge protection and electromagnetic interference filters installed correctly? (These devices MUST not be installed on the output side of the inverter.)	<u>p.30</u>	
	Are STP (shielded twisted pair) cables used for control terminal wiring?	-	
Control Terminal	Is the shielding of the STP wiring properly grounded?	-	
Wiring	If 3-wire operation is required, are the multi-function input terminals defined prior to the installation of the control wiring connections?	<u>p.39</u>	

ltems	Check Point	Ref.	Result
	Are the control cables properly wired?	<u>p39</u>	
	Are the control terminal screws tightened to their specified torques?	<u>p.21</u>	
	Is the total cable length of all control wiring < 165ft (100m)?	<u>p.46</u>	
	Is the total length of safety wiring < 100ft (30m)?	<u>p.46</u>	
	Are optional cards connected correctly?	-	
	Is there any debris left inside the inverter?	<u>p.21</u>	
	Are any cables contacting adjacent terminals, creating a potential short circuit risk?	-	
	Are the control terminal connections separated from the power terminal connections?	-	
Miscellaneous	Have the capacitors been replaced if they have been in use for > 2 years?	-	
	Have the fans been replaced if they have been in use for > 3 years?	-	
	Has a fuse been installed for the power source?	<u>p.229</u>	
	Are the connections to the motor separated from other connections?	-	

Note

I

STP (Shielded Twisted Pair) cable has a highly conductive, shielded screen around twisted cable pairs. STP cables protect conductors from electromagnetic interference.

2.4 Test Run

After the post-installation checklist has been completed, follow the instructions below to test the inverter.

- 1 Turn on the power supply to the inverter. Ensure that the keypad display light is on.
- 2 Select the command source.
- 3 Set a frequency reference, and then check the following:
 - If V1 is selected as the frequency reference source, does the reference change according to the input voltage at VR?
 - If V2 is selected as the frequency reference source, is the voltage/current selector switch (SW2) set to voltage, and does the reference change according to the input voltage?
 - If I2 is selected as the frequency reference source, is the voltage/current selector switch (SW2) set to current, and does the reference change according to the input current?
- 4 Set the acceleration and deceleration time.
- 5 Start the motor and check the following:
 - Ensure that the motor rotates in the correct direction (refer to the note below).
 - Ensure that the motor accelerates and decelerates according to the set times, and that the motor speed reaches the frequency reference.

Note

If the forward command (Fx) is on, the motor should rotate counterclockwise when viewed from the load side of the motor. If the motor rotates in the reverse direction, switch the cables at the U and V terminals.

Remarque

Si la commande avant (Fx) est activée, le moteur doit tourner dans le sens anti-horaire si on le regarde côté charge du moteur. Si le moteur tourne dans le sens inverse, inverser les câbles aux bornes U et V.

Verifying the Motor Rotation

- 1 On the keypad, set the drv (Frequency reference source) code in the Operation group to 0 (Keypad).
- 2 Set a frequency reference.
- **3** Press the [RUN] key. Motor starts forward operation.
- 4 Observe the motor's rotation from the load side and ensure that the motor rotates counterclockwise (forward).

If the motor rotates in the reverse direction, two of the U/V/W terminals need to be switched.

① Caution

- Check the parameter settings before running the inverter. Parameter settings may have to be adjusted depending on the load.
- To avoid damaging the inverter, do not supply the inverter with an input voltage that exceeds the rated voltage for the equipment.
- Before running the motor at maximum speed, confirm the motor's rated capacity. As inverters can be used to easily increase motor speed, use caution to ensure that motor speeds do not accidently exceed the motor's rated capacity.

٦

Memo

3 Learning to Perform Basic Operations

This chapter describes the keypad layout and functions. It also introduces parameter groups and codes, required to perform basic operations. The chapter also outlines the correct operation of the inverter before advancing to more complex applications. Examples are provided to demonstrate how the inverter actually operates.

3.1 About the Keypad

٢

The keypad is composed of two main components – the display and the operation (input) keys. Refer to the following illustration to identify part names and functions.

0.4-22kW Models

3.1.2 30-75kW Models

1

3.1.3 About the Display

Г

The following table lists display part names and their functions.

3.1.3.1 0.4-22kW Models

No.	Name	Function		
0	7-Segment Display	Displays current operational status and parameter information.		
2	SET Indicator	LED flashes during parameter configuration and when the ESC key operates as the multi-function key.		
0	RUN Indicator	LED turns on (steady) during an operation, and flashes during acceleration or deceleration.		
4	FWD Indicator	LED turns on (steady) during forward operation.		
6	REV Indicator	LED turns on (steady) during reverse operation.		

The table below lists the way that the keypad displays characters (letters and numbers).

Ū	0	R	А	Ł	К	Ľ	U
{	1	Ь	В	1	L	IJ.	V

3.1.4 Operation Keys

3.1.4.1 0.4-22kW Models

① Caution

Г

Install a separate emergency stop switch in the circuit. The [STOP/RESET] key on the keypad works only when the inverter has been configured to accept an input from the keypad.

The following table lists the names and functions of the keypad's operation keys.

Key	Name	Description	
RUN	[RUN] key	Used to run the inverter (inputs a RUN command).	
STOP RESET	[STOP/RESET]	STOP: stops the inverter.	
	key	RESET: resets the inverter following fault or failure condition.	
	[▲] key, [▼] key	Switch between codes, or to increase or decrease	
, ∟		parameter values.	
	[◀] key, [▶] key	Switch between groups, or to move the cursor during	
(,)		parameter setup or modification.	
ENT	[ENT] key	Used to select, confirm, or save a parameter value.	
		A multi-function key used to configure different functions, such	
		as:	
ESC	[ESC] key	Jog operation	
		Remote/Local mode switching	
		Cancellation of an input during parameter setup	

3.1.4.2 30-75kW Models

The following table lists the names and functions of the LCD's operation keys.

٦

Key	Name	Description
MODE	[MODE] Key	Used to switch between modes.
PROG /ENT	[PROG / Ent] Key	Used to select, confirm, or save a parameter value.
	[UP] key [DOWN] key	Switch between codes or increase or decrease parameter values.
	[LEFT] key [RIGHT] key	Switch between groups or move the cursor during parameter setup or modification.
MULTI	[MULTI] Key	Used to perform special functions, such as user code registration.
ESC	[ESC] Key	 Used to cancel an input during parameter setup. Pressing the [ESC] key before pressing the [PROG / ENT] key reverts the parameter value to the previously set value. Pressing the [ESC] key while editing the codes in any function group makes the keypad display the first code of the function group. Pressing the [ESC] key while moving through the modes makes the keypad display Monitor mode.
FWD	[FWD] Key	Used to operate the motor in the forward direction.
REV	[REV] Key	Used to operate the motor in the reversed direction.
STOP	[STOP/RESET] Key	Used to stop motor operation. Used to reset the inverter following fault or failure condition.

3.1.5 Control Menu

Γ

0.4-22kW Control Menu

The following table lists the functions groups under Parameter mode.

Function Group Name	Keypad Display	LCD Display	Description
	0.00	DRV-01	Configures reference frequencies.
		DRV-03	Configures acceleration times.
		DRV-04	Configures deceleration times.
	dru	DRV-06	Used to select operation command.
	Q L	DRV-07	Configures operation frequencies.
		BAS-50	Configures the Step Freq. 1 of the multi-step frequencies.
Operation	512	BAS-51	Configures Step Freq. 2 of the multi-step frequencies.
		BAS-52	Configures Step Freq. 2 of the multi-step frequencies.
	<u>lur</u>		Displays current output current.
	r P	Monitor Line Display	Displays current speed of a load (RPM).
		(CNF-20~23)	Displays current DC LINK voltage.
			Displays current output voltage.
	nlu	TRP Last-1	Displays recent trip history.
	dr	-	Used to select motor operation direction.
Drive	dr	DRV	Configures parameters for basic operations. These include jog operation, motor capacity evaluation, torque boost, and other keypad related parameters.
Basic	5 <i>R</i>	BAS	Configures basic operation parameters. These parameters include motor parameters and multi-step frequency parameters.
Advanced	Rd	ADV	Configures acceleration or deceleration patterns, frequency limits, etc.
Control	[n	CON	Configures sensorless vector-related features.
Input Terminal	i n	IN	Configures input terminal–related features, including digital multi–functional inputs and analog inputs.
Output Terminal	<u>[]</u> []	OUT	Configures output terminal-related features

Function Group Name	Keypad Display	LCD Display	Description	
			such as relays and analog outputs.	
Communication		СОМ	Configures communication features for RS- 485 or other communication options.	
Application	8P	APP	Configures functions related to PID control.	
Protection	Pr	PRT	Configures motor and inverter protection features.	
Motor 2 (Secondary motor)	ñđ	M2	Configures secondary motor related features. The secondary motor (M2) group appears on the keypad only when one of the multi- function input terminals (In.65–In.71) has been set to 26 (Secondary motor).	
User Sequence	45	USS	- Used to implement simple sequences with various function blocks.	
User Sequence Function	ЦF	USF		

30-75kW Control Menu

Г

The S100 inverter uses 5 modes to monitor or configure different functions. The parameters in Parameter mode are divided into smaller groups of relevant functions. Press the [Mode] key to change to Parameter mode.

69

LSELECTRIC

The following table lists the 5 display modes used to control the inverter functions.

٦

Mode Name	LCD Display	Description
Monitor mode	MON	Displays the inverter's operation status information. In this mode, information including the inverter's frequency reference, operation frequency, output current, and voltage may be monitored.
Parameter mode	PAR	Used to configure the functions required to operate the inverter. These functions are divided into 14 groups based on purpose and complexity.
Trip mode	TRP	Used to monitor the inverter's fault trip information, including the previous fault trip history. When a fault trip occurs during inverter operation, the operation frequency, output current, and output voltage of the inverter at the time of the fault may be monitored. This mode is not displayed if the inverter is not at fault and fault trip history does not exist.
Config mode	CNF	Used to configure the inverter features that are not directly related to the operation of the inverter. The settings you can configure in the Config mode include keypad display language options, monitor mode environment settings, communication module display settings, and parameter duplication and initialization.

3.2 Learning to Use the Keypad

The keypad enables movement between groups and codes. It also enables users to select and configure functions. At code level, you can set parameter values to turn on or off specific functions, or decide how the functions will be used. Refer to <u>4 Table of Functions</u> on page <u>103</u> to find the functions you need.

Confirm the correct values (or the correct range of the values), and then follow the examples below to configure the inverter with the keypad.

3.2.1 Display Mode Selection (30-75kW models only)

The following figure illustrates how the display modes change when you press the [Mode] button on the keypad. You can continue to press the [Mode] key until you get to the desired mode.

User mode and Trip mode are not displayed when all the inverter settings are set to the factory default (User mode must be configured before it is displayed on the keypad, and Trip mode is displayed only when the inverter is at fault, or has previous trip fault history).

Mode selection in factory default condition

Switching between groups when Trip mode is added

Г

Trip mode is accessible only when the inverter has trip fault history. Refer to <u>3 Learning to</u> <u>Perform Basic Operations</u> on page <u>59</u> for information about monitoring faults.

3.2.2 Group and Code Selection

Follow the examples below to learn how to switch between groups and codes.

٦

3.2.2.1 0.4-22kW Models

Step	Instruction	Keypad Display
1	Move to the group you want using the [◀] and [▶] keys.	
2	Move up and down through the codes using the [▲] and [▼] keys until you locate the code that you require.	
3	Press the [ENT] key to save the change.	-

For some settings, pressing the $[\blacktriangle]$ or $[\blacktriangledown]$ key will not increase or decrease the code number by 1. Code numbers may be skipped and not be displayed. This is because certain code numbers have been intentionally left blank (or reserved) for new functions to be added in the future. Also some features may have been hidden (disabled) because a certain code has been set to disable the functions for relevant codes.

As an example, if Ad.24 (Frequency Limit) is set to 0 (No), the next codes, Ad.25 (Freq Limit Lo) and Ad.26 (Freq Limit Hi), will not be displayed. If you set code Ad.24 to 1 (Yes) and enable the frequency limit feature, codes Ad.25 and 26 will appear to allow the maximum and minimum frequency limitations to be set up.

3.2.2.2 30-75kW Models (Switching Groups)

Press the [MODE] key to display a specific mode. Modes displayed change in the following order:

75

LSELECTRIC

Switching between Groups in Parameter Display Mode

After entering Parameter mode from Monitor mode, press the $[\Box]$ key to change the display as shown below. Press the $[\Box]$ key to return to the previous mode.

3.2.2.3 30-75kW Models (Code Navigation)

Code Navigation in Monitor mode

Г

In monitor mode, press the $[\blacktriangle]$, $[\blacktriangledown]$ key to display frequency, the output current, or voltage according to the cursor position.

MON T/K N STP 0,0Hz Frequency 0,00 Hz 0.0 A 0 V	 When the power is turned on, Monitor mode is displayed. The cursor appears to the left of the frequency information. Press the [▼] key.
MON T/K N STP 0,0Hz 0.0 Hz Output Current 0,0 A 0 V	 Information about the second item in Monitor mode (Output Current) is displayed. Wait for 2 seconds until the information on the display disappears.
MON T/K N STP 0,0Hz 0.0 Hz ■ 0.0 A 0 V	 Information about the second item in Monitor mode (Output Current) disappears and the cursor reappears to the left of the second item. Press the [▼] key.
MON T/K N STP 0,0Hz 0.0 Hz 0.0 A Output Voltage 0 V	 Information about the third item in Monitor mode (Output Voltage) is displayed. Wait for 2 seconds until the information on the display disappears.
MON T/K N STP 0,0Hz O.O Hz O.O A ■ O V	 Information about the third item in Monitor mode (Output Voltage) disappears and the cursor appears to the left of the third item. Press the [▼] key twice.

MON T/K N STP 0,0Hz Frequency 0,00 Hz 0.0 A 0 V	 Information about the first item in Monitor mode (Frequency) is displayed.
MON T/K N STP 0,0Hz 0.0 Hz 0.0 A 0 V	 Information about the first item in Monitor mode (Frequency) disappears and the cursor appears to the left of the first item.

1

Code Navigation in Parameter mode

The following examples show you how to move through codes in different function groups (Drive group and Basic group) in Parameter mode. In parameter mode, press the $[\blacktriangle]$ or $[\lor]$ key to move to the desired functions.

MON T/K N STP 0,0Hz 0.0 Hz 0.0 A 0 V	 When the power is on, monitor mode is displayed. Press the [MODE] key.
PAR → DRV N STP 0,0Hz 00 Jump Code 9 CODE 01 Cmd Frequency 0.00 Hz 02 Acc Time 20.0 sec	 Drive group (DRV) in Parameter mode is displayed. If any other group is displayed, press the [MODE] key until the Drive group is displayed, or press the [ESC] key.
PAR → DRV N STP 0,0Hz 00 Jump Code 9 CODE 01 Cmd Frequency 0.00 Hz 02 Acc Time 20.0 sec	 Press the [♥] key to move to the second code (DRV-01) of Drive group. Press the [▶] key
PAR → BAS N STP 0,0Hz 00 Jump Code 20 CODE 01 Aux Ref Src 02 Cmd 2nd Src Fx/Rx-1	 Basic group is displayed. Press the [▲] or [♥] key to move to the desired codes and configure the inverter functions.

3.2.3 Navigating Directly to Different Codes

3.2.3.1 0.4-22kW Models

Г

The following example details navigating to code dr. 95, from the initial code in the Drive group (dr. 0). This example applies to all groups whenever you would like to navigate to a specific code number.

Step	Instruction	Keypad Display
1	Ensure that you are currently at the first code of the Drive group (dr.0).	dr.0
2	Press the [ENT] key. Number '9' will flash.	
3	Press the [▼] key to display '5,' the first 1s' place of the group destination, '95.'	
4	Press the [◀] key to move to the 10s' place. The cursor will move to the left and '05' will be displayed. This time, the number '0' will be flashing.	
5	Press the $[\blacktriangle]$ key to increase the number from '0' to '9,' the 10s place digit of the destination, '95.'	35
6	Press the [ENT] key. Code dr.95 is displayed.	dr.35

3.2.3.2 30-75kW Models

Parameter mode and Config mode allow direct jumps to specific codes. The code used for this feature is called the Jump Code. The Jump Code is the first code of each mode. The Jump Code feature is convenient when navigating for a code in a function group that has many codes.

The following example shows how to navigate directly to code DRV- 09 from the initial code (DRV-00 Jump Code) in the Drive group.

PAR → DRV N STP 0,0Hz 00 Jump Code 9 CODE 01 Cmd Frequency 0.00 Hz 02 Acc Time 20.0 sec	 The Drive group (DRV) is displayed in Parameter mode. Make sure that the fist code in the Drive group (DRV 00 Jump Code) is currently selected. Press the [PROG/ENT] key.
PAR → DRV N STP 0,0Hz 00 Jump Code 9 CODE 01 Cmd Frequency 0.00 Hz 02 Acc Time 20.0 sec	 The Code input screen is displayed and the cursor flashes. A flashing cursor indicates that it is waiting for user input.
PAR → DRV N STP 0,0Hz 00 Jump Code 9 CODE 1~99 CODE D:9 C:9	 Press the [▲] key to increase the number to 9, and then press the [PROG/ENT] key.
PAR → DRV N STP 0,0Hz U9 Control Mode V/F 10 Torque Control No 11 JOG Frequency 10.00 Hz	DRV-09 (Control Mode) is displayed.
PAR → DRV N STP 0,0Hz 00 Jump Code 9 CODE 01 Cmd Frequency 0.00 Hz 02 Acc Time 20.0 sec	 Press the [ESC] key to go back to the initial code of the Drive group.

3.2.4 Setting Parameter Values

3.2.4.1 0.4-22kW Models

Enable or disable features by setting or modifying parameter values for different codes. Directly enter setting values, such as frequency references, supply voltages, and motor speeds. Follow the instructions below to learn to set or modify parameter values.

Step	Instruction	Keypad Display	
1	Select the group and code to setup or modify parameter settings, and then press the [ENT] key. The first number on the right side of the display will flash.	5 .2	
2	Press the [◀] or [▶] key to move the cursor to the number that you would like to modify.	() () () () () () () ()	
3	Press the [▲] or [▼] key to adjust the value, and then press the [ENT] key to confirm it. The selected value will flash on the display.	5.5 5.5 4.5	
4	Press the [ENT] key again to save the change.	-	

Note

- A flashing number on the display indicates that the keypad is waiting for an input from the user. Changes will be saved when the [ENT] key is pressed while the number is flashing. The setting change will be canceled if you press any other key.
- Each code's parameter values have default features and ranges specified. Refer to <u>4 Table</u> of <u>Functions</u> on page <u>103</u> for information about the features and ranges before setting or modifying parameter values.

3.2.4.2 30-75kW Models

Parameter settings available in Monitor mode

The S100 inverter allows basic parameters to be modified in Monitor mode. The following example shows how to set the frequency.

Parameter settings in other modes and groups

Г

The following example shows how to change the frequency in the Drive group. This example can also be applied to other modes and groups.

PAR → DRV N STP 0,0Hz 00 Jump Code 9 CODE 01 Cmd Frequency 0.00 Hz 02 Cmd Torque 0.0 %	 This is the initial display for Parameter mode. Press the [▼] key.
PAR → DRV N STP 0,0Hz 00 Jump Code 9 CODE 01 Cmd Frequency 0.00 Hz 02 Cmd Torque 0.0 %	 DRV-01 code is selected. Press the [PROG/ENT] key.
PAR → DRV N STP 0,0Hz 01Cmd Frequency 0.00 Hz 0.50 ~ 60.00 Hz D:0.00 C:10.00	 The frequency can be changed at the flashing digit. Press the [◀]/ [▶] key to move the cursor to the desired digit.
PAR → DRV N STP 0,0Hz 01Cmd Frequency 10.00 Hz 0.50 ~ 60.00 Hz D:0.00 C:10.00	 Press the [▲] key to enter 10 Hz, and then press the [PROG/ENT] key.
PAR → DRV N STP 0,0Hz 00 Jump Code 9 CODE 01 Cmd Frequency 10.00 Hz 02 Cmd Torque 0.0 %	The frequency is changed to 10 Hz.

3.2.5 Configuring the [ESC] Key (0.4-22kW models only)

The [ESC] key is a multi-functional key that can be configured to carry out a number of different functions. The following example shows how to configure the [ESC] key to perform a jog operation.

Step	Instruction	Keypad Display
1	Ensure that you are currently at the first code of the Operation group, and that code 0.00 (Command Frequency) is displayed.	
2	Press the [▶] key. You have moved to the initial code of the Drive group (dr.0).	dr.D
3	Press the [▲] or [▼] key to select code 90 (ESC key configuration), and then press the [ENT] key. Code dr.90 currently has an initial parameter value of, 0 (adjust to the initial position).	
4	Press the [▲] key to modify the value to 1 (Jog key) and then press the [ENT] key. The new parameter value will flash.	
5	Press the [ENT] key again to save changes.	-

Note

- If the code dr. 90 (ESC key configuration) is set to 1 (JOG Key) or 2 (Local/Remote), the SET indicator will flash when the [ESC] key is pressed.
- The factory default setting for code dr. 90 is 0 (move to the initial position). You can navigate back to the initial position (code 0.00 of the Operation group) immediately, by pressing the [ESC] key while configuring any codes in any groups.

3.3 Actual Application Examples

Г

3.3.1 Acceleration Time Configuration (0.4-22kW models only)

The following is an example demonstrating how to modify the ACC (Acceleration time) code value (from 5.0 to 16.0) from the Operation group.

Step	Instruction	Keypad Display
1	Ensure that the first code of the Operation group is selected, and code 0.00 (Command Frequency) is displayed.	
2	Press the [▲] key. The display will change to the second code in the Operation group, the ACC (Acceleration Time) code.	
3	Press the [ENT] key. The number '5.0' will be displayed, with '0' flashing. This indicates that the current acceleration time is set to 5.0 seconds. The flashing value is ready to be modified by using the keypad.	5.2
4	Press the [◀] key to change the first place value. '5' will be flashing now. This indicates the flashing value, '5' is ready to be modified.	5. D
5	Press the $[\blacktriangle]$ key to change the number '5' into '6', the first place value of the target number '16.'	5.0
6	Press the [◀] key to move to the 10s, place value. The number in the 10s position, '0' in '06' will start to flash	
7	Press the [▲] key to change the number from '0' to '1', to match the 10s place value of the target number'16,' and then press the [ENT] key. Both digits will flash on the display.	
8	Press the [ENT] key once again to save changes. 'ACC' will be displayed. The change to the acceleration time setup has been completed.	REE

3.3.2 Frequency Reference Configuration (0.4-22kW models only)

The following is an example to demonstrate configuring a frequency reference of 30.05 (Hz) from the first code in the Operation group (0.00).

Step	Instruction	Keypad Display
1	Ensure that the first code of the Operation group is selected, and the code 0.00 (Command Frequency) is displayed.	
2	Press the [ENT] key. The value, 0.00 will be displayed with the '0' in the 1/100s place value flashing.	
3	Press the [◀] key 3 times to move to the 10s place value. The '0' at the 10s place value will start to flash.	
4	Press the $[\blacktriangle]$ key to change it to '3,' the 10s place value of the target frequency, '30.05.'	
5	Press the [▶] key 3 times. The '0' at the 1/100s place position will flash.	JU.U.
6	Press the [▲] key to change it to '5,' the 1/100 place value of the target frequency, '30.05,' and then press the [ENT] key. The parameter value will flash on the display.	
7	Press the [ENT] key once again to save changes. Flashing stops. The frequency reference has been configured to 30.05 Hz.	30.05

Note

- A flashing number on the display indicates that the keypad is waiting for an input from the user. Changes are saved when the [ENT] key is pressed while the value is flashing. Changes will be canceled if any other key is pressed.
- The S100 inverter keypad display can display up to 4 digits. However, 5-digit figures can be used and are accessed by pressing the [◀] or [▶] key, to allow keypad input.

3.3.3 Jog Frequency Configuration (0.4-22kW models only)

٢

The following example demonstrates how to configure Jog Frequency by modifying code 11 in the Drive group (Jog Frequency) from 10.00(Hz) to 20.00(Hz). You can configure the parameters for different codes in any other group in exactly the same way.

Step	Instruction	Keypad Display
1	Go to code 11(Jog Frequency) in the Drive group.	dr. 11
2	Press the [ENT] key. The current Jog Frequency value (10.00) for code dr.11 is displayed.	
3	Press the [◀] key 3 times to move to the 10s place value. Number '1' at the 10s place position will flash.	
4	Press the [▲] key to change the value to '2,' to match the 10s place value of the target value'20.00,' and then press the [ENT] key. All parameter digits will flash on the display.	
5	Press the [ENT] key once again to save the changes. Code dr.11 will be displayed. The parameter change has been completed.	<u>dr.11</u>

3.3.4 Initializing All Parameters

3.3.4.1 0.4-22kW Models

The following example demonstrates parameter initialization using code dr.93 (Parameter Initialization) in the Drive group. Once executed, parameter initialization will delete all modified values for all codes and groups.

Step	Instruction	Keypad Display
1	Go to code 0 (Jog Frequency) in the Drive group.	dr.[]
2	Press the [ENT] key. The current parameter value (9) will be displayed.	
3	Press the [q] key to change the first place value to '3' of the target code, '93.'	
4	Press the [◀] key to move to the 10s place position. '03' will be displayed.	
5	Press the [▲] or [▼] key to change the '0' to '9' of the target code, '93.'	
6	Press the [ENT] key. Code dr.93 will be displayed.	dr.33
7	Press the [ENT] key once again. The current parameter value for code dr.93 is set to 0 (Do not initialize).	
8	Press the [▲] key to change the value to 1 (All Grp), and then press the [ENT] key. The parameter value will flash.	
9	Press the [ENT] key once again. Parameter initialization begins. Parameter initialization is complete when code dr.93 reappears on the display.	[ฮะ.วีฮิ

Note

Following parameter initialization, all parameters are reset to factory default values. Ensure that parameters are reconfigured before running the inverter again after an initialization.

3.3.4.2 30-75kW Models

Г

The following example demonstrates how to revert all the parameter settings back to the factory default (Parameter Initialization). Parameter initialization may be performed for separate groups in Parameter mode as well.

MON T/K N STP 0,0A 0.0 Hz 0.0 A 0 V	Monitor mode is displayed.
CNF N STP 0,0A 00 Jump Code 9 CODE 01 Language Sel 02 Inv S/V Ver Version 1.00	Press the [MODE] key to move to the Config (CNF) mode.
CNF N STP 0,0A 31 Option-2 Type None 32 Option-3 Type None 40 Parameter Init No	 Press the [▼] key to go to CNF-40 (Parameter Init). Press the [PROG/ENT] key.
CNF N STP 0,0A 40 Parameter Init 0No 1 All Groups 2 DRV	 In the list of options, select All Groups, and then press the [PROG/ENT] key.
CNF N STP 0,0A 31 Option-2 Type None 32 Option-3 Type None 40 Parameter Init No	The parameter initialization option is displayed again when the initialization is complete.

3.3.5 Frequency Setting (Keypad) and Operation (via Terminal Input)

Step	Instruction	Keypad Display
1	Turn on the inverter.	-
2	Ensure that the first code of the Operation group is selected, and code 0.00 (Command Frequency) is displayed, then press the [ENT] key. The first digit on the right will flash.	
3	Press the [◀] key 3 times to go to the 10s place position. The number '0' at the 10s place position will flash.	
4	Press the [▲] key to change it to 1, and then press the [ENT] key. The parameter value (10.00) will flash.	
5	Press the [ENT] key once again to save changes. A change of reference frequency to 10.00 Hz has been completed.	
6	Refer to the wiring diagram at the bottom of the table, and close the switch between the P1 (FX) and CM terminals. The RUN indicator light flashes and the FWD indicator light comes on steady. The current acceleration frequency is displayed.	
7	When the frequency reference is reached (10Hz), open the switch between the P1 (FX) and CM terminals. The RUN indicator light flashes again and the current deceleration frequency is displayed. When the frequency reaches 0Hz, the RUN and FWD indicator lights turn off, and the frequency reference (10.00Hz) is displayed again.	SET TO .OO REV

1

[Wiring Diagram]

Г

The instructions in the table are based on the factory default parameter settings. The inverter may not work correctly if the default parameter settings are changed after the inverter is purchased. In such cases, initialize all parameters to reset the values to factory default parameter settings before following the instructions in the table.

3.3.6 Frequency Setting (Potentiometer) and Operation (Terminal Input)

Step	Instruction	Keypad Display
1	Turn on the inverter.	-
2	Ensure that the first code of the Operation group is selected, and the code 0.00 (Command Frequency) is displayed.	0.00
3	Press the [▲] key 4 times to go to the Frq (Frequency reference source) code.	ب آب ع
4	Press the [ENT] key. The Frq code in the Operation group is currently set to 0 (keypad).	
5	Press the [▲] key to change the parameter value to 2 (Potentiometer), and then press the [ENT] key. The new parameter value will flash.	
6	Press the [ENT] key once again. The Frq code will be displayed again. The frequency input has been configured for the potentiometer.	٦-٦
7	Press the [▼] key 4 times. Returns to the first code of the Operation group (0.00).From here frequency setting values can be monitored.	
8	Adjust the potentiometer to increase or decrease the frequency reference to 10Hz.	-
9	Refer to the wiring diagram at the bottom of the table, and close the switch between the P1 (FX) and CM terminals. The RUN indicator light flashes and the FWD indicator light comes on steady. The current acceleration frequency is displayed.	
10	When the frequency reference is reached (10Hz), open the switch between the P1 (FX) and CM terminals. The RUN indicator light flashes again and the current deceleration frequency is displayed. When the frequency reaches 0Hz, the RUN and FWD indicators turn off, and the frequency reference (10.00Hz) is displayed again.	SET I Ø . Ø Ø REV

The instructions in the table are based on the factory default parameter settings. The inverter may not work correctly if the default parameter settings are changed after the inverter is purchased. In such cases, initialize all parameters to reset the factory default parameter settings before following the instructions in the table.

3.3.7 Frequency Setting (Potentiometer) and Operation (Keypad)

Step	Instruction	Keypad Display
1	Turn on the inverter.	-
2	Ensure that the first code of the Operation group is selected, and the code 0.00 (Command Frequency) is displayed.	
3	Press the $[\blacktriangle]$ key 4 times to go to the drv code.	<u>ה</u> רח
4	Press the [ENT] key. The drv code in the Operation group is currently set to 1 (Analog Terminal).	
5	Press the [▼] key to change the parameter value to 0 (Keypad), and then press the [ENT] key. The new parameter value will flash.	
6	Press the [ENT] key once again. The drv code is displayed again. The frequency input has been configured for the keypad.	<u>ל</u> רש
7	Press the [▲] key. To move to the Frq (Frequency reference source) code.	
8	Press the [ENT] key. The Frq code in the Operation group is set to 0 (Keypad).	

Step	Instruction	Keypad Display
9	Press the [▲] key to change it to 2 (Potentiometer), and then press the [ENT] key. The new parameter value will flash.	
10	Press the [ENT] key once again. The Frq code is displayed again. The frequency input has been configured for potentiometer.	<u>ل</u> ة - ح
11	Press the [▼] key 4 times. Returns to the first code of the Operation group (0.00). From here frequency setting values can be monitored.	
12	Adjust the potentiometer to increase or decrease the frequency reference to 10Hz.	-
13	Press the [RUN] key on the keypad. The RUN indicator light flashes and the FWD indicator light comes on steady. The current acceleration frequency is displayed.	
14	When the frequency reaches the reference (10Hz), press the [STOP/RESET] key on the keypad. The RUN indicator light flashes again and the current deceleration frequency is displayed. When the frequency reaches 0Hz, the RUN and FWD indicator lights turn off, and the frequency reference (10.00Hz) is displayed again.	SET RUN II.III REV

Г

The instructions in the table are based on the factory default parameter settings. The inverter may not work correctly if the default parameter settings are changed after the inverter is purchased. In such cases, initialize all parameters to reset the factory default parameter settings before following the instructions in the table.

3.4 Monitoring the Operation

3.4.1 0.4-22kW Models

3.4.1.1 Output Current Monitoring

The following example demonstrates how to monitor the output current in the Operation group using the keypad.

Step	Instruction	Keypad Display
1	Ensure that the first code of the Operation group is selected, and the code 0.00 (Command Frequency) is displayed.	
2	Press the $[\blacktriangle]$ or $[\blacktriangledown]$ key to move to the Cur code.	
3	Press the [ENT] key. The output current (5.0A) is displayed.	5.0
4	Press the [ENT] key again. Returns to the Cur code.	

Note

You can use the dCL (DC link voltage monitor) and vOL (output voltage monitor) codes in the Operation group in exactly the same way as shown in the example above, to monitor each function's relevant values.

3.4.1.2 Fault Trip Monitoring

٢

The following example demonstrates how to monitor fault trip conditions in the Operation group using the keypad.

Step	Instruction	Keypad Display
1	Refer to the example keypad display. An over current trip fault has occurred.	
2	Press the [ENT] key, and then the [▲] key. The operation frequency at the time of the fault (30.00Hz) is displayed.	30.00
3	Press the [▲] key. The output current at the time of the fault (5.0A) is displayed.	5.0
4	Press the [▲] key. The operation status at the time of the fault is displayed. ACC on the display indicates that the fault occurred during acceleration.	ALL
5	Press the [STOP/RESET] key. The inverter resets and the fault condition is cleared. The frequency reference is displayed on the keypad.	30.00

• If multiple fault trips occur at the same time, a maximum of 3 fault trip records can be retrieved as shown in the following example.

• If a warning condition occurs while running at a specified frequency, the current frequency and the signal will be displayed alternately, at 1 second intervals.

3.4.2 30-75kW Models

How to use Monitor mode

Γ

There are 3 types of items that may be monitored in Monitor mode. Some items, including frequency, may be modified. Users can select the items to be displayed in Config mode (CNF).

MON T/K N STP 0,0Hz 10.0 Hz 0.0 A 0 V	 Monitor mode Frequency, current, and voltage are set as the default monitored items. The target frequency is displayed when the inverter is stopped. The operation frequency is displayed while operating.
CNF N STP 0.0Hz 21 Monitor Line-1 Frequency 22 Monitor Line-2 Output Current 23 Monitor Line-3 Output Voltage	 Configure the items to be displayed in Config mode (CNF) 21~23. Press the [♥] key to go to 23.
CNF N STP 0.0Hz 21 Monitor Line-1 Frequency 22 Monitor Line-2 Output Current 23 Monitor Line-3 Output Voltage	 Press the[PROG/ENT] key to change 23 to output power.
MON TAK N STP 0.0Hz 0.0 Hz 0.0 A 0.0 KW	 Press the[ESC] key to ensure that the third item in Monitor mode is changed to output power.

Items available for monitoring

Mode	Number	Display	Setti	ng Range	Initial value
CNF	20	Anytime Para	0	Frequency	0: Frequency
	21	Monitor Line-1	1	Speed	0: Frequency
	22	Monitor Line-2	2	Output Current	2:Output Current
	23 Monitor Line-3	Monitor Line-3	3	Output Voltage	3:Output Voltage

٦

How to use the status bar

On the top-right corner of the display, there is a display item. This item is displayed as long as the inverter is on, regardless of the mode the inverter is operating in.

Monitoring Faults during Inverter Operation

The following example shows how to monitor faults that occurred during inverter operation.

٦

TRP current Over Voltage (01) 01 Output Freq 48.30 Hz 02 Output Current 33.3 A	If a fault trip occurs during inverter operation, the inverter enters Trip mode automatically and displays the type of fault trip that occurred.
TRP Last-1 01 Output Freq 48.30 Hz 02 Output Current 33.3 A 03 Inverter State Stop	 Press the [▼] key to view the information on the inverter at the time of fault, including the output frequency, output current, and operation type.
MON T/K N STP 0,0A O.O Hz O.O A O V	 When the inverter is reset and the fault trip is released, the keypad display returns to the screen it was at when the fault trip occurred.

Monitoring Multiple Fault Trips

The following example shows how to monitor multiple faults that occur at the same time.

Fault trip history saving and monitoring

When fault trips occur, the trip mode saves the content. Up to five fault trips are saved in the history. Trip mode saves when the inverter is reset, and when a Low Voltage fault trip occurs due to power outages. If a trip occurs more than five times, the information for the five previous trips are automatically deleted.

TRP current Over Voltage (02) 01 Output Freq 48.30 Hz 02 Output Current 33.3 A	 If a fault trip occurs during inverter operation, the inverter enters Trip mode automatically and displays the type of fault trip that occurred.
MON T/K N STP 0,0A 0.0 Hz 0.0 A 0 V	 After the [RESET] key or terminal is pressed, the fault trip is saved automatically and returns to the screen it was on before the fault trip occurred. Press the [MODE] key toenterTrip mode.

TRP current OV Trip Name (02) Over Voltage 01 Output Freq 48.30 Hz 02 Output Current 33.3 A	 The most recent fault trip is saved in Last-1 code. Press the [▶] key.
TRP current 00 Trip Name (01) External Trip 01 Output Freq 48.30 Hz 02 Output Current 33.3 A	 The fault trip changes position and is saved in Last-2 code. When a fault trip occurs again, the content in Last-2 is moved to Last-3.

4 Table of Functions

This chapter lists all the function settings for S100 series inverter. Set the parameters required according to the following references. If a set value input is out of range, the following messages will be displayed on the keyboard. In these cases, the inverter will not operate with the [ENT] key.

- Set value not allocated: rd
- Set value repetition (multi-function input, PID reference, PID feedback related): OL
- Set value not allowed (select value, V2, I2): no

4.1 Operation Group

The Operation group is used only in the basic keypad mode. It will not be displayed on an LCD loader.

4.12 User Sequence group (US)

ſ

This group appears when AP.02 is set to 1 (Yes) or CM.95 is set to 2 (P2P Master). The parameter cannot be changed while the user sequence is running.

SL: Sensorless vector control function (dr.09), I – IM Sensorless, P – PM Sensorless ***O/X**: Write-enabled during operation, **7/L/A**: keypad/LCD keypad/common

5 Troubleshooting

This chapter explains how to troubleshoot a problem when inverter protective functions, fault trips, warning signals, or a fault occurs. If the inverter does not work normally after following the suggested troubleshooting steps, please contact the LS ELECTRIC customer service center.

5.1 Trips and Warnings

When the inverter detects a fault, it stops the operation (trips) or sends out a warning signal. When a trip or warning occurs, the keypad displays the information briefly. If the LCD keypad is used, detailed information is shown on the LCD display. Users can read the warning message at Pr.90. When more than 2 trips occur at roughly the same time, the keypad (basic keypad with 7-segment display) displays the higher priority fault trip information, while the LCD keypad shows the information for the fault trip that occurred first.

The fault conditions can be categorized as follows:

- Level: When the fault is corrected, the trip or warning signal disappears and the fault is not saved in the fault history.
- Latch: When the fault is corrected and a reset input signal is provided, the trip or warning signal disappears.
- Fatal: When the fault is corrected, the fault trip or warning signal disappears only after the user turns off the inverter, waits until the charge indicator light goes off, and turns the inverter on again. If the inverter is still in a fault condition after powering it on again, please contact the supplier or the LS ELECTRIC customer service center.

5.1.1 Fault Trips

Protection Functions for Output Current and Input Voltage

Keypad Display	LCD Display	Туре	Description
	Over Load	Latch	Displayed when the motor overload trip is activated and the actual load level exceeds the set level. Operates when Pr.20 is set to a value other than 0.
	Under Load	Latch	Displayed when the motor underload trip is activated and the actual load level is less than the set level. Operates when Pr.27 is set to a value other than 0.
	Over Current1	Latch	Displayed when inverter output current exceeds 200% of the rated current.
	Over Voltage	Latch	Displayed when internal DC circuit voltage exceeds the specified value.
	Low Voltage	Level	Displayed when internal DC circuit voltage is less than the specified value.
	Low Voltage2	Latch	Displayed when internal DC circuit voltage is less than the specified value during inverter operation.
	Ground Trip*	Latch	Displayed when a ground fault trip occurs on the output side of the inverter and causes the current to exceed the specified value. The specified value varies depending on inverter capacity.
ELH	E-Thermal	Latch	Displayed based on inverse time-limit thermal characteristics to prevent motor overheating. Operates when Pr.40 is set to a value other than 0.
Püł	Out Phase Open	Latch	Displayed when a 3-phase inverter output has one or more phases in an open circuit condition. Operates when bit 1 of Pr.05 is set to 1.
; 7;	In Phase Open	Latch	Displayed when a 3-phase inverter input has one or more phases in an open circuit condition. Operates only when bit 2 of Pr.05 is set to 1.
	Inverter OLT	Latch	Displayed when the inverter has been protected from overload and resultant overheating, based on inverse time-limit thermal characteristics. Allowable overload rates for the inverter are 150% for 1 min and 200% for 4 sec. Protection is based on inverter rated capacity, and may vary depending on the device's capacity.
- The second sec	No Motor Trip	Latch	Displayed when the motor is not connected during inverter operation. Operates when Pr.31 is set to 1.

* S100 inverters rated for 4.0kW or less do not support the ground fault trip (GFT) feature. Therefore, an over current trip (OCT) or over voltage trip (OVT) may occur when there is a low-resistance ground fault.

* For products with built-in filters, CPU Reset or OCT or OC2 Trip can occur in an anomaly in which the Surge input (such as Lightning Surge) is received.

Protection Functions Using Abnormal Internal Circuit Conditions and External Signals

Keypad Display	LCD Display	Туре	Description
	Over Heat	Latch	Displayed when the temperature of the inverter heat sink exceeds the specified value.
	Over Current2	Latch	Displayed when the DC circuit in the inverter detects a specified level of excessive, short circuit current.
<u> </u>	External Trip	Latch	Displayed when an external fault signal is provided by the multi-function terminal. Set one of the multi-function input terminals at In.65-71 to 4 (External Trip) to enable external trip.
<u>b</u> -	BX	Level	Displayed when the inverter output is blocked by a signal provided from the multi-function terminal. Set one of the multi-function input terminals at In.65-71 to 5 (BX) to enable input block function.
<u> </u>	H/W-Diag	Fatal	Displayed when an error is detected in the memory (EEPRom), analog-digital converter output (ADC Off Set), or CPU watchdog (Watch Dog-1, Watch Dog-2). EEP Err: An error in reading/writing parameters due to keypad or memory (EEPRom) fault. ADC Off Set: An error in the current sensing circuit
nt	NTC Open	Latch	(U/V/W terminal, current sensor, etc.). Displayed when an error is detected in the temperature sensor of the Insulated Gate Bipolar Transistor (IGBT).
FAn	Fan Trip	Latch	Displayed when an error is detected in the cooling fan. Set Pr.79 to 0 to activate fan trip (for models below 22kW capacity).
	Pre-PID Fail	Latch	Displayed when pre-PID is operating with functions set at AP.34–AP.36. A fault trip occurs when a controlled variable (PID feedback) is measured below the set value and the low feedback continues, as it is treated as a load fault.
<u>הק</u> ר	Ext-Brake	Latch	Operates when the external brake signal is provided by the multi-function terminal. Occurs when the inverter output starting current remains below the set value at Ad.41. Set either OU.31 or OU.32 to 35 (BR Control).
5FA 5Fb	Safety A(B) Err	Latch	Displayed when at least one of the two safety input signals is off.

Protection Functions for Communication Options

Keypad Display	LCD Display	Туре	Description
	Lost Command	Level	Displayed when a frequency or operation command error is detected during inverter operation by controllers other than the keypad (e.g., using a terminal block and a communication mode). Activate by setting Pr.12 to any value other than 0.
i üe Hüld	IO Board	Latch	Displayed when the I/O board or external communication card is not connected to the inverter or there is a bad connection.
ErrE	Trip	Laich	Displayed when the HILd error code continues for more than 5 sec. ('Errc' -> '-rrc' -> E-rc' -> 'Er-c' -> 'Err-' -> 'rc' -> 'Er ' -> ''-> 'Errc' ->)
PAr	ParaWrite Trip	Latch	Displayed when communication fails during parameter writing. Occurs when using an LCD keypad due to a control cable fault or a bad connection.
Option Trip-		Displayed when a communication error is detected between the inverter and the communication board. Occurs when the communication option card is installed.	

5.1.2 Warning Messages

Keypad Display	LCD Display	Description
	Over Load	Displayed when the motor is overloaded. Operates when Pr.17 is set to 1. To operate, select 5. Set the digital output terminal or relay (OU.31 or OU.33) to 5 (Over Load) to receive overload warning output signals.
	Under Load	Displayed when the motor is underloaded. Operates when Pr.25 is set to 1. Set the digital output terminal or relay (OU.31 or OU.33) to 7 (Under Load) to receive underload warning output signals.
	INV Over Load	Displayed when the overload time equivalent to 60% of the inverter overheat protection (inverter IOLT) level, is accumulated. Set the digital output terminal or relay (OU.31 or OU.33) to 6 (IOL) to receive inverter overload warning output signals.
	Lost Command	Lost command warning alarm occurs even with Pr.12 set to 0. The warning alarm occurs based on the condition set at Pr.13-15. Set the digital output terminal or relay (OU.31 or OU.33) to 13 (Lost Command) to receive lost command warning output signals. If the communication settings and status are not suitable for P2P, a Lost Command alarm occurs.
Fān'	Fan Warning	Displayed when an error is detected from the cooling fan while Pr.79 is set to 1. Set the digital output terminal or relay (OU.31 or OU.33) to 8 (Fan Warning) to receive fan warning output signals
	DB Warn %ED	Displayed when the DB resistor usage rate exceeds the set value. Set the detection level at Pr.66.
ErEr	Retry Tr Tune	Tr tune error warning alarm is activated when Dr.9 is set to 4. The warning alarm occurs when the motor's rotor time constant (Tr) is either too low or too high.
<u> </u>	PID Sleep	When the PID operation enters sleep mode, a warning occurs.

5.2 Troubleshooting Fault Trips

When a fault trip or warning occurs due to a protection function, refer to the following table for possible causes and remedies.

Туре	Cause	Remedy	
	The load is greater than the motor's	Ensure that the motor and inverter

	rated capacity.	that has increased capacity.
	The set value for electronic thermal	Set an appropriate electronic thermal
	protection is too low.	level.
	The inverter has been operated at low speed for an extended duration.	Replace the motor with a model that supplies extra power to the cooling fan.
Output Phase	The magnetic contactor on the output side has a connection fault.	Check the magnetic contactor on the output side.
Open	The output wiring is faulty.	Check the output wiring.
	The magnetic contactor on the input side has a connection fault.	Check the magnetic contactor on the input side.
Input Phase	The input wiring is faulty.	Check the input wiring.
Open	The DC link capacitor needs to be replaced.	Replace the DC link capacitor. Contact the retailer or the LS ELECTRIC customer service center.
Inverter OLT	The load is greater than the rated motor capacity.	Replace the motor and inverter with models that have increased capacity.
	The torque boost level is too high.	Reduce the torque boost level.
	There is a problem with the cooling system.	Determine if a foreign object is obstructing the air inlet, outlet, or vent.
Over Heat	The inverter cooling fan has been operated for an extended period.	Replace the cooling fan.
	The ambient temperature is too high.	Keep the ambient temperature below 50 _ີ C.
	Output wiring is short-circuited.	Check the output wiring.
Over Current2	There is a fault with the electronic semiconductor (IGBT).	Do not operate the inverter. Contact the retailer or the LS ELECTRIC customer service center.
NTC Open	The ambient temperature is too low.	Keep the ambient temperature above -10℃.
	There is a fault with the internal temperature sensor.	Contact the retailer or the LS ELECTRIC customer service center.
FAN Trip /	A foreign object is obstructing the fan's air vent.	Remove the foreign object from the air inlet or outlet.
FAN Warning	The fan connector is not connected.	Connect the fan connector.
	The cooling fan needs to be replaced.	Replace the cooling fan.

5.3 Troubleshooting Other Faults

When a fault other than those identified as fault trips or warnings occurs, refer to the following table for possible causes and remedies.

Туре	Cause	Remedy
	The inverter is in operation (driving mode).	Stop the inverter to change to program mode and set the parameter.
Parameters	The parameter access is incorrect.	Check the correct parameter access level and set the parameter.
cannot be set.	The password is incorrect.	Check the password, disable the parameter lock and set the parameter.
	Low voltage is detected.	Check the power input to resolve the low voltage and set the parameter.
	The frequency command source is set incorrectly.	Check the frequency command source setting.
	The operation command source is set incorrectly.	Check the operation command source setting.
	Power is not supplied to the terminal R/S/T.	Check the terminal connections R/S/T and U/V/W.
	The charge lamp is turned off.	Turn on the inverter.
	The operation command is off.	Turn on the operation command (RUN).
	The motor is locked.	Unlock the motor or lower the load level.
	The load is too high.	Operate the motor independently.
	An emergency stop signal is input.	Reset the emergency stop signal.

	The input voltage or current for the	Check the input voltage or current
	frequency command is incorrect.	for the frequency command.
	The PNP/NPN mode is selected incorrectly.	Check the PNP/NPN mode setting.
	The frequency command value is too low.	Check the frequency command and input a value above the minimum frequency.
	The [STOP/RESET] key is pressed.	Check that the stoppage is normal, if so resume operation normally.
	Motor torque is too low.	Change the operation modes (V/F, IM, and Sensorless). If the fault remains, replace the inverter with a

Туре	Cause	Remedy
		model with increased capacity.
The motor rotates in the	The wiring for the motor output cable is incorrect.	Determine if the cable on the output side is wired correctly to the phase (U/V/W) of the motor.
opposite direction to the command.	The signal connection between the control circuit terminal (forward/reverse rotation) of the inverter and the forward/reverse rotation signal on the control panel side is incorrect.	Check the forward/reverse rotation wiring.
The motor only	Reverse rotation prevention is selected.	Remove the reverse rotation prevention.
rotates in one direction.	The reverse rotation signal is not provided, even when a 3-wire sequence is selected.	Check the input signal associated with the 3-wire operation and adjust as necessary.
		Reduce the load. Increase the Acc/Dec time.
	The load is too heavy.	Check the motor parameters and set the correct values.
		Replace the motor and the inverter with models with appropriate capacity for the load.
	The ambient temperature of the motor is too high.	Lower the ambient temperature of the motor.
The motor is overheating.		Use a motor that can withstand phase-to-phase voltages surges greater than the maximum surge voltage.
	The phase-to-phase voltage of the motor is insufficient.	Only use motors suitable for applications with inverters.
		Connect the AC reactor to the inverter output (set the carrier frequency to 2 kHz).
	The motor fan has stopped or the fan is obstructed with debris.	Check the motor fan and remove any foreign objects.
The motor stops		Reduce the load.
during acceleration or when connected to load.	The load is too high.	Replace the motor and the inverter with models with capacity appropriate for the load.
The motor does	The frequency command value is low.	Set an appropriate value.
not accelerate. /The acceleration	The load is too high.	Reduce the load and increase the acceleration time. Check the mechanical brake status.
time is too long.	The acceleration time is too long.	Change the acceleration time.

Туре	Cause	Remedy
	The combined values of the motor properties and the inverter parameter are incorrect.	Change the motor related parameters.
	The stall prevention level during acceleration is low.	Change the stall prevention level.
	The stall prevention level during operation is low.	Change the stall prevention level.
	Starting torque is insufficient.	Change to vector control operation mode. If the fault is still not corrected, replace the inverter with a model with increased capacity.
Motor speed	There is a high variance in load.	Replace the motor and inverter with models with increased capacity.
varies during	The input voltage varies.	Reduce input voltage variation.
operation.	Motor speed variations occur at a specific frequency.	Adjust the output frequency to avoid a resonance area.
The motor rotation is different from the setting.	The V/F pattern is set incorrectly.	Set a V/F pattern that is suitable for the motor specification.
The motor	The deceleration time is set too long.	Change the setting accordingly.
deceleration time is too long even with Dynamic	The motor torque is insufficient.	If motor parameters are normal, it is likely to be a motor capacity fault. Replace the motor with a model with increased capacity.
Braking (DB) resistor connected.	The load is higher than the internal torque limit determined by the rated current of the inverter.	Replace the inverter with a model with increased capacity.
Operation is	The carrier frequency is too high.	Reduce the carrier frequency.
difficult in underload applications.	Over-excitation has occurred due to an inaccurate V/F setting at low speed.	Reduce the torque boost value to avoid over-excitation.
While the inverter is in operation, a	Noise occurs due to switching inside	Change the carrier frequency to the minimum value.
control unit malfunctions or noise occurs.	the inverter.	Install a micro surge filter in the inverter output.
When the inverter is operating, the earth leakage breaker is	An earth leakage breaker will interrupt the supply if current flows to ground during inverter operation.	Connect the inverter to a ground terminal. Check that the ground resistance is less than 100Ω for 200V inverters and less than 10Ω for 400V
activated.		inverters.

Туре	Cause	Remedy
		Check the capacity of the earth leakage breaker and make the appropriate connection, based on the rated current of the inverter. Lower the carrier frequency. Make the cable length between the inverter and the motor as short as possible.
The motor vibrates severely and does not rotate normally.	Phase-to-phase voltage of 3-phase power source is not balanced.	Check the input voltage and balance the voltage. Check and test the motor's insulation.
The motor	Resonance occurs between the motor's natural frequency and the carrier frequency.	Slightly increase or decrease the carrier frequency.
makes humming, or loud noises.	Resonance occurs between the motor's natural frequency and the inverter's output frequency.	Slightly increase or decrease the carrier frequency. Use the frequency jump function to avoid the frequency band where resonance occurs.
The motor	The frequency input command is an external, analog command.	In situations of noise inflow on the analog input side that results in command interference, change the input filter time constant (In.07).
vibrates/hunts.	The wiring length between the inverter and the motor is too long.	Ensure that the total cable length between the inverter and the motor is less than 200m (50m for motors rated 3.7 kW or lower).
The motor does not come to a complete stop	It is difficult to decelerate sufficiently, because DC braking is not operating	Adjust the DC braking parameter. Increase the set value for the DC braking current.
when the inverter output stops.	normally.	Increase the set value for the DC braking stopping time.
The output	The frequency reference is within the jump frequency range.	Set the frequency reference higher than the jump frequency range.
frequency does not increase to the frequency	The frequency reference is exceeding the upper limit of the frequency command.	Set the upper limit of the frequency command higher than the frequency reference.
reference.	Because the load is too heavy, the stall prevention function is working.	Replace the inverter with a model with increased capacity.
The cooling fan does not rotate.	The control parameter for the cooling fan is set incorrectly.	Check the control parameter setting for the cooling fan.

Memo

6 Maintenance

This chapter explains how to replace the cooling fan, the regular inspections to complete, and how to store and dispose of the product. An inverter is vulnerable to environmental conditions and faults also occur due to component wear and tear. To prevent breakdowns, please follow the maintenance recommendations in this section.

① Caution

- · Before you inspect the product, read all safety instructions contained in this manual.
- · Before you clean the product, ensure that the power is off.
- Clean the inverter with a dry cloth. Cleaning with wet cloths, water, solvents, or detergents may result in electric shock or damage to the product.

6.1 Regular Inspection Lists

6.1.1 Daily Inspections

Inspection area	Inspection item	Inspection details	Inspection method	Judgment standard	Inspection equipment
	Ambient environment	Is the ambient temperature and humidity within the design range, and is there any dust or foreign objects present?	Refer to <u>1.3</u> <u>Installation</u> <u>Considerations</u> on page <u>8</u> .	No icing (ambient temperature: - 10 - +40) and no condensation (ambient humidity below 50%)	Thermometer, hygrometer, recorder
All	Inverter	Is there any abnormal vibration or noise?	Visual inspection	No abnormality	
	Power voltage	Are the input and output voltages normal?	Measure voltages between R/ S/ T-phases in. the inverter terminal block.	Refer to <u>7.1</u> Input and Output Specification on page <u>203</u> .	Digital multimeter tester
Input/Output circuit	Smoothing capacitor	Is there any leakage from the inside?	Visual inspection	No abnormality	-

Inspection area	Inspection item	Inspection details	Inspection method	Judgment standard	Inspection equipment
		Is the capacitor swollen?			
Cooling system	Cooling fan	Is there any abnormal vibration or noise?	Turn off the system and check operation by rotating the fan manually.	Fan rotates smoothly	-
Display	Measuring device	ls the display value normal?	Check the display value on the panel.	Check and manage specified values.	Voltmeter, ammeter, etc.
Motor All		ls there any abnormal vibration or noise?	Visual inspection	No	
WIOLOI	All	Is there any abnormal smell?	Check for overheating or damage.	abnormality	-

6.1.2 Annual Inspections

Inspection area	Inspection item	Inspection details	Inspection method	Judgment standard	Inspection equipment
Input/Output circuit	All	Megger test (between input/output terminals and earth terminal)	Disconnect inverter and short R/S/T/U/V/W terminals, and then measure from each terminal to the ground terminal using a Megger.	Must be above 5 MΩ	DC 500 V Megger
		Is there anything loose in the device?	Tighten up all screws.	No	
		Is there any evidence of parts overheating?	Visual inspection	abnormality	
	Cable connections	Cable Are there any		No abnormality	-

Inspection area	Inspection item	Inspection details	Inspection method	Judgment standard	Inspection equipment	
		cables? Is there any damage to cable insulation?				
	Terminal block	ls there any damage?	Visual inspection	No abnormality	-	
	Smoothing condenser	Measure electrostatic capacity.	Measure with capacity meter.	Rated capacity over 85%	Capacity meter	
	Relay	Is there any chattering noise during operation? Is there any	Visual inspection Visual	No abnormality	-	
		damage to the contacts?	inspection			
		Is there any damage from resistance?	Visual inspection	No abnormality		
	Braking resistor	Check for disconnection.	Disconnect one side and measure with a tester.	Must be within ±10% of the rated value of the resistor.	Digital multimeter / analog tester	
Control circuit Protection	Operation check	Check for output voltage imbalance while the inverter is in operation.	Measure voltage between the inverter output terminal U/ V/ W.	Balance the voltage between phases: within 4V for 200V series and within 8V for 400V series.	Digital multimeter or DC voltmeter	
circuit		Is there an error in the display circuit after the sequence protection test?	Test the inverter output protection in both short and open circuit conditions.	The circuit must work according to the sequence.		
Cooling system	Cooling fan	Are any of the fan parts	Check all connected	No abnormality	-	

Γ

LSELECTRIC 199

Inspection area	Inspection item	Inspection details	Inspection method	Judgment standard	Inspection equipment
		loose?	parts and tighten all screws.		
Display	Display device	ls the display value normal?	Check the command value on the display device.	Specified and managed values must match.	Voltmeter, Ammeter, etc.

6.1.3 Bi-annual Inspections

Inspection	Inspection	Inspection	Inspection	Judgment	Inspection
area	item	details	method	standard	equipment
Motor	Insulation resistance	Megger test (between the input, output and earth terminals).	Disconnect the cables for terminals U/V/ W and test the wiring.	Must be above 5 MΩ	DC 500 V Megger

① Caution

Do not run an insulation resistance test (Megger) on the control circuit as it may result in damage to the product.

6.2 Replacing Major Components

Refer to following for information on replacing major components.

6.2.1 Exchange Cycle for Major Components

Following table shows the cycles and information for major components.

Components	Exchange standard	Symptom	Action
Cooling fan	3 years	Spinning failure	Make inquiries to the A/S center and replace it with a new product.
Main circuit electrolytic condenser	3 years	Capacity reduction	Make inquiries to the A/S center and replace it with a new product.
Main circuit relay	-	Operation failure	Make inquiries to the A/S center.

Note

The life times of major components are based on the operating rated load consecutively. The lifetime may be different according to conditions and environment.

6.3 Storage and Disposal

6.3.1 Storage

If you are not using the product for an extended period, store it in the following way:

- Store the product in the same environmental conditions as specified for operation (refer to <u>1.3 Installation Considerations</u> on page <u>8</u>).
- When storing the product for a period longer than 3 months, store it between 10°C and 30°C, to prevent depletion of the electrolytic capacitor.
- Do not expose the inverter to snow, rain, fog, or dust.
- Package the inverter in a way that prevents contact with moisture. Keep the moisture level below 70% in the package by including a desiccant, such as silica gel.

6.3.2 Disposal

When disposing of the product, categorize it as general industrial waste. Recyclable materials are included in the product, so recycle them whenever possible. The packing materials and all metal parts can be recycled. Although plastic can also be recycled, it can be incinerated under controlled conditions in some regions.

Caution

If the inverter has not been operated for a long time, capacitors lose their charging characteristics and are depleted. To prevent degradation, turn on the product once a year and allow the device to operate for 30-60 min. Run the device under no-load conditions.

7 Technical Specification

7.1 Input and Output Specification

7.1.1 0.4-22kW Models

Single Phase 200V (0.4-2.2 kW)

Model 🗆	□□ □ \$100-1[0004	0008	0015	0022

• The standard motor capacity is based on a standard 4-pole motor.

• The standard used for 200 V inverters is based on a 220 V supply voltage, and for 400V inverters is based on a 440 V supply voltage.

• The rated output current is limited based on the carrier frequency set at Cn.04.

• The output voltage becomes 20~40% lower during no-load operations to protect the inverter from the impact of the motor closing and opening (0.4-4.0kW models only).

• The standard motor capacity is based on a standard 4-pole motor.

• The standard used for 200 V inverters is based on a 220 V supply voltage, and for 400V inverters is based on a 440 V supply voltage.

• The rated output current is limited, based on the carrier frequency set at Cn.04.
Note

Precautions for 1-phase input to 3-phase drive

- Please connect single-phase input to R(L1) and T(L3).
- AC or DC reactor is necessary to reduce DC ripple. Please select built-in reactor type for 30-75kW. For 0.4-22kW, external AC or DC reactor should be installed.
- Same peripheral devices (including a fuse and reactor) as 3-phase can be used for 1-phase as well.
- If phase open trip occurs, please turn off the input phase open protection(PR-05).
- Protection for output current like OCT or IOLT is based on 3-phase input ratings which is larger than single-phase input. User should set the parameters that are relative to motor information(bA-11~16), overload trip(Pr-17~22) and E-thermal functions(Pr-40~43)
- Performance of sensorless control could be unstable depending on DC ripple.
- The minimum input voltage must be larger than 228Vac for 240Vac supply and 456Vac for 480Vac supply to ensure motor voltage production of 207Vac and 415Vac, respectively.
- To minimize the effect of voltage deprivation, please choose 208Vac motor for 240Vac supply and 400Vac motor for 480Vac supply.

7.1.2 30-75kW Models

Technical Specification

ltems	Description
	option.)IP66(NEMA 4X Indoor Only)
Input Mode	 0.4-22kW: Keypad (LCD loader: Installation available but sold separately.) 30-75kW: LCD loader
Ambient temperature	Heavy load: -10-50°C (14-122°F), normal load: -10-40°C (14-104°F) No ice or frost should be present. Working under normal load at 50°C (122°F), it is recommended that less than 80% load is applied.
Ambient hu	midity Relative humidity less than 90% RH (to avoid condensation forming)
Storage temperature	-20°C-65°C (-4-149°F)
Surrounding environmen	I OII SIGINS, OUSE AND OTHER DOULLIANTS (POULUION LIEDRES)
Operation a / Vibration	Ititude Maximum 1000m above sea level for standard operation. From 1000 to 4000m, the rated input voltage and rated output current of the drive must be derated by 1% for every 100m. / less than 1G (9.8m/sec ²)
Pressure	70-106 kPa

*, ** IP66 models do not support normal load operation.

① Caution

Apply the rated torque when tightening terminal screws. Loose screws may cause short circuits and malfunctions. Overtightening terminal screws may damage the terminals and cause short circuits and malfunctions. Use copper conductors only, rated at 600V, 75°C for power terminal wiring, and rated at 300V, 75°C for control terminal wiring.

OAttention

Appliquer des couples de marche aux vis des bornes. Des vis desserrées peuvent provoquer des courts-circuits et des dysfonctionnements. Ne pas trop serrer la vis, car cela risque d'endommager les bornes et de provoquer des courts-circuits et des dysfonctionnements. Utiliser uniquement des fils de cuivre avec une valeur nominale de 600 V, 75 $^{\circ}$ pour le câblage de la borne d'alimentation, et une valeur nominale de 300 V, 75 $^{\circ}$ pour le câblage de la borne de commande.

7.7 Dynamic Braking Unit(DBU) and Resistors

7.7.5 Display Functions

DB Resistors connect with B1, B2 of DB Unit. DBU has 3 LEDs. Red LED which is located in middle displays supplying main power, one Green LED which is right side displays under braking and another green LED which is left side displays Over Heat Trip(OHT).

Displays	Function description
POWER (Red LED)	POWER LED is turned On when main power is supplied. Generally, POWER LED is turn On while main power supplied because DBU is connected with inverter.
RUN (Green LED)	RUN LED is turned off while DBU is ON by regenerative energy of Motor.
OHT (Green LED)	Under Braking, if the temperature is exceeded over setting value due to over heat of Heatsink, Cut the TURN ON signal of DBU and LED is turn on by working overheat protection function.

7.7.6 Dynamic Braking Unit Resistors

Product(kW)	DB Unit	Resistor(Ω)	Capacity(W)	Reference
30kW	SV370DBU-4U	16.9	6,400	
37kW	SV370DBU-4U	16.9	6,400	100% braking
45kW	SV550DBU-4U	11.4	9,600	torque,
55kW	SV550DBU-4U	11.4	9,600	10%ED
75kW	SV750DBU-4U	8.4	12,800	

Note

- The resistance/rated capacity/braking torque/%ED of DB Resistor are valid only for the DB unit of type A and the values of DB Resistor for type B and C refer to the manual of DB Unit..
- Rating Watt of DBU has to be doubled when %ED is doubled.

7.8 Continuous Rated Current Derating

Carrier Frequency Setting Range and Default Values (by product capacity)

4.0kW-2	77	5.5kW-4	82		
5.5kW-2	118	7.5kW-4	75		

Heat emission data is based on operations with default carrier frequency settings, under normal operating conditions.
Technical Specification

7.10 Remote Option

The composition consists of a remote control loader and cables(1m,2m,3m,5m).

Installation.

- **5** Take off the top cover of the I/O board kit and remove the hole cover to connect remote cable on the side.
- 6 Connect the other side of the remote cable to the remote keypad as shown below.

8 Applying Drives to Single-Phase Input Application

8.1 Introduction

LSLV-S100 is a three-phase standard variable frequency drive(VFD). When applying single-phase power to a three-phase VFD, there are several constraints that need to be considered. Standard Pulse-Width-Modulated (PWM) VFDs use a 6-pulse diode rectifier. The 6-pulse rectification results in 360 Hz DC bus ripple when used with a three-phase 60 Hz supply.

However, under single-phase use, the DC bus ripple becomes 120 Hz and the VFDs DC bus circuit is subject to higher stress in order to deliver equivalent power.

Additionally, input currents and harmonics increase beyond those encountered with threephase input.

Input current distortion of 90% THD and greater can be expected under single-phase input, compared to approximately 40% with three-phase input as indicated in Figure 2.

Therefore, single-phase use requires the three-phase VFD power rating be reduced (derated) to avoid over stressing the rectifier and DC link components.

Figure-2 Typical Single-Phase Configuration

8.2 Power(HP), Input Current and Output Current

When using a three-phase VFD with single-phase input, derating the drive's output current and horsepower will be necessary because of the increase in DC bus ripple voltage and current. In addition, the input current through the remaining two phases on the diode bridge converter will approximately double, creating another derating consideration for the VFD. Input current harmonic distortion will increase beyond that with a three-phase supply making the overall input power factor low. Input current distortion over 100% is likely under single-phase conditions without a reactor. Therefore, the reactor is always required. When using a motor that is selected by the three-phase drive rating criteria when using singlephase input, it may result in poor performance, premature drive failure. The selected drive of single-phase current ratings must meet or exceed the motor current rating.

8.3 Input Frequency and Voltage Tolerance

The single-phase current ratings are valid for 60Hz input only. The AC supply voltage must be within the required voltage range of 240/480Vac +10% to -5% to maximize motor power production. Standard product with three-phase voltage input has an allowable range of +10% to -15%. Therefore, a stricter input voltage tolerance of +10 to -5% applies when using the drive with a single-phase supply. The average bus voltage with single-phase input is lower than the equivalent of a three-phase input. Therefore, the maximum output voltage (motor voltage) will be lower with a single-phase input. The minimum input voltage must be no less than 228Vac for 240 volt models and 456Vac for 480 volt models, to ensure motor voltage production of 207Vac and 415Vac, respectively. Thus, if full motor torque must be developed near base speed (full power) it will be necessary to maintain a rigid incoming line voltage so that adequate motor voltage can be produced. Operating a motor at reduced speed (reduced power), or using a motor with a base voltage that is lower than the incoming AC supply rating (ex. 208Vac motor with a 240Vac supply), will also minimize the effect of voltage deprivation. (240VAC Input \rightarrow 208V motor, 480VAC Input \rightarrow 400V motor)

247 LSELECTRIC

Product Warranty

Warranty Information

Fill in this warranty information form and keep this page for future reference or when warranty service may be required.

Product Name	LS ELECTRIC Standard Inverter	Date of Installation
Model Name	LSLV-S100	Warranty Period
	Name (or company)	
Customer Info	Address	
	Contact Info.	
	Name	
Retailer Info	Address	
	Contact info.	

Warranty Period

The product warranty covers product malfunctions, under normal operating conditions, for 12 months from the date of installation. If the date of installation is unknown, the product warranty is valid for 18 months from the date of manufacturing. Please note that the product warranty terms may vary depending on purchase or installation contracts.

Warranty Service Information

During the product warranty period, warranty service (free of charge) is provided for product malfunctions caused under normal operating conditions. For warranty service, contact an official LS ELECTRIC agent or service center.

Non-Warranty Service

A service fee will be incurred for malfunctions in the following cases:

- intentional abuse or negligence
- power supply problems or from other appliances being connected to the product
- acts of nature (fire, flood, earthquake, gas accidents etc.)
- modifications or repair by unauthorized persons
- missing authentic LS ELECTRIC rating plates
- expired warranty period

Visit Our Website

Visit us at https://www.lselectric.co.kr for detailed service information.

EC DECLARATION OF CONFORMITY

We, the undersigned,

Representative:	LS Electric Co., Ltd.
Address:	LS Tower, 127, LS-ro, Dongan-gu,
	Anyang-si, Gyeonggi-do,
	Korea
Manufacturer:	LS Electric Co., Ltd.
Address:	56, Samseong 4-gil, Mokcheon-eup,
	Dongnam-gu, Cheonan-si, Chungcheongnam-do,
	Korea

Certify and declare under our sole responsibility that the following apparatus:

Type of Equipment:	Inverter (Power Conversion Equipment)
Model Name:	LSLV-S100 series
Trade Mark:	LS Electric Co., Ltd.

Conforms with the essential requirements of the directives:

2014/35/EU Directive of the European Parliament and of the Council on the harmonisation of the laws of the Member States relating to the making available on the market of electrical equipment designed for use within certain voltage limits

2014/30/EU Directive of the European Parliament and of the Council on the harmonisation of the laws of the Member States relating to electromagnetic compatibility

Based on the following specifications applied:

EN 61800-3:2004/A1:2012 EN 61800-5-1:2007

and therefore complies with the essential requirements and provisions of the 2014/35/CE and 2014/30/CE Directives.

Place:

Cheonan, Chungnam, Korea

3 x5 72 2016.1.13 (Signature 2)

Mr. Sang Chun Moon / General Manager (Full name / Position)

UL mark

The UL mark applies to products in the United States and Canada. This mark indicates that UL has tested and evaluated the products and determined that the products satisfy the UL standards for product safety. If a product received UL certification, this means that all components inside the product had been certified for UL standards as well.

Suitable for Installation in a compartment Handing Conditioned Air

CE mark

The CE mark indicates that the products carrying this mark comply with European safety and environmental regulations. European standards include the Machinery Directive for machine manufacturers, the Low Voltage Directive for electronics manufacturers and the EMC guidelines for safe noise control.

Low Voltage Directive

We have confirmed that our products comply with the Low Voltage Directive (EN 61800-5-1).

EMC Directive

The Directive defines the requirements for immunity and emissions of electrical equipment used within the European Union. The EMC product standard (EN 61800-3) covers requirements stated for drives.

EAC mark

The EAC (EurAsian Conformity) mark is applied to the products before they are placed on the market of the Eurasian Customs Union member states.

It indicates the compliance of the products with the following technical regulations and requirements of the Eurasian Customs Union:

Technical Regulations of the Customs Union 004/2011 "On safety of low voltage equipment" Technical Regulations of the Customs Union 020/2011 "On electromagnetic compatibility of technical products"

EMI / RFI POWER LINE FILTERS

LS inverters, S100 series

RFI FILTERS

THE LS RANGE OF POWER LINE FILTERS FEB (Standard) and FF (Footparing) SERIES. HAVE BEEN SPECIFICALLY DESIGNED WITH HIGH FREQUENCY LSC INVERTERS. THE USE OF LS FILTERS, WITH THE INSTALLATION ADVICE OVERLEAF HELP TO ENSURE TROUBLE FREE USE ALONG SDE SENSITIVE DEVICES AND COMPLIANCE TO CONDUCTED EMISSION AND IMMUNITY STANDARS TO EN 50061.

CAUTION

IN CASE OF A LEAKAGE CURRENT PROTECTIVE DEVICES IS USED ON POWER SUPPLY, IT MAY BE FAULT AT POWER-ON OR OFF. IN AVOID THIS CASE, THE SENSE CURRENT OF PROTECTIVE DEVICE SHOULD BE LARGER

RECOMMENDED INSTALLATION INSTRUCTIONS

To conform to the **EMC** directive, it is necessary that these instructions be followed as closely as possible. Follow the usual safety procedures when working with electrical equipment. All electrical connections to the filter, inverter and motor must be made by a qualified electrical technician.

1-) Check the filter rating label to ensure that the current, voltage rating and part number are correct.

- 2-) For best results the filter should be fitted as closely as possible to the incoming mains supply of the wiring enclousure, usually directly after the enclousures circuit breaker or supply switch.
- 3-) The back panel of the wiring cabinet of board should be prepared for the mounting dimensions of the filter. Care should be taken to remove any paint etc... from the mounting holes and face area of the panel to ensure the best possible earthing of the filter.
- 4-) Mount the filter securely.
- 5-) Connect the mains supply to the filter terminals marked LINE, connect any earth cables to the earth stud provided. Connect the filter terminals marked LOAD to the mains input of the inverter using short lengths of appropriate gauge cable.
- 6-) Connect the motor and fit the <u>ferrite core (</u> output chokes) as close to the inverter as possible. Armoured or screened cable should be used with the 3 phase conductors only threaded twice through the center of the ferrite core. The earth conductor should be securely earthed at both inverter and motor ends. The screen should be connected to the enclousure body via and earthed cable gland.
- 7-) Connect any control cables as instructed in the inverter instructions manual.

IT IS IMPORTANT THAT ALL LEAD LENGHTS ARE KEPT AS SHORT AS POSSIBLE AND THAT INCOMING MAINS AND OUTGOING MOTOR CABLES ARE KEPT WELL SEPARATED.
